(54) Title: IDENTIFICATION OF *STREPTOCOCCUS PNEUMONIAE* SEROTYPES

(57) Abstract: The present invention relates to molecular methods of serotyping *Streptococcus pneumoniae*, as well as polynu-
cleotides useful in such methods. These methods rely on analysing at least a portion of the nucleotide sequence between the 3' end
of the *cpsA* gene and the 5' end of the *cpsB* gene, and/or analysing at least a portion of the *szx* and/or *wzx* gene(s).

1

IDENTIFICATION OF *STREPTOCOCCUS PNEUMONIAE* SEROTYPES**FIELD OF THE INVENTION**

The present invention relates to molecular methods of serotyping *Streptococcus*
5 *pneumoniae*, as well as polynucleotides useful in such methods.

BACKGROUND OF THE INVENTION

Streptococcus pneumoniae is a leading cause of morbidity and mortality causing
invasive disease such as meningitis and pneumonia as well as more localised disease
10 such as acute otitis media and sinusitis. Polysaccharide and protein-conjugate
pneumococcal vaccines have the potential to prevent a significant proportion of cases.
Effective protein-conjugate vaccines are particularly important because of the dramatic
increase in prevalence and international dissemination of antibiotic resistant *S.*
pneumoniae serotypes that commonly cause invasive disease in children (Hausdorff et
15 el., 2001; Huebner, et al., 2000). However these vaccines protect against only the
relatively small minority (Dunne et al., 2001; Hausdorff et al., 2001) of pneumococcal
serotypes that most commonly cause disease. There is theoretical and limited empirical
evidence that widespread use of these vaccines could lead to substitution of "vaccine"
serotypes with other nonvaccine serotypes, against which the vaccines do not provide
20 protection. Continued surveillance will be critical to monitor vaccine efficacy and
changes in incidence and distribution of colonising and invasive serotypes (Hausdorff
et al., 2001; Rubins et al., 1999). Any increase in disease caused by previously
uncommon nonvaccine serotypes could necessitate a change in vaccine composition
(Lipsitch, 2001).

25 *S. pneumoniae* comprises at least 90 serotypes, distinguished by capsular
polysaccharide antigens. Pneumococcal serotype/group identification is currently
performed, using large panels of expensive antisera, by various methods, including
capsular swelling (Quellung) reaction - the traditional "gold standard" - latex
agglutination and coagglutination (Arai et al., 2001; Lalitha et al., 1999). Cross-
30 reactions between serotypes and discrepancies between methods can occur and some
strains are nonserotypable (Henrichsen, 1999).

The capsular polysaccharide synthesis (*cps*) gene clusters for at least 16
pneumococcal serotypes have been sequenced and serotype-specific genes identified
(Jiang et al., 2001; van Selm et al., 2002). The *cps* gene cluster contains genes
35 responsible for synthesis of the serotype-specific polysaccharide including - except in
serotype 3 - *wzy* (polysaccharide polymerase gene) and *wzx* (polysaccharide flippase

gene). At the 5'-end of the *cps* gene cluster are four relatively conserved open reading frames - *cpsA* (*wzg*)-*cpsB* (*wzh*)-*cpsC* (*wzd*)-*cpsD* (*wze*). Sequence differences in this region were used to classify 11 *S. pneumoniae* serotypes into two classes and, in the region between the 3'-end of *cpsA* and the 5'-end of *cpsB*, there were sites of
5 heterogeneity between and within serotypes (Jiang et al., 2001; Lawrence et al., 2000). *S. pneumoniae* is characterised by high frequency recombination within the *cps* gene cluster, leading to serotype "switching" among isolates within genetic lineages defined by relationships between their more conserved housekeeping genes (Coffey et al., 1998; Jiang et al., 2001).

10 The relatively low percentage of polymorphisms between strains which is linked to actual serotype, and the large number of different serotypes, has made the development of assays which can be used for typing a significant portion of *S. pneumoniae* strains difficult. Accordingly, there is a need for further methods which can be used to identify different *Streptococcus pneumoniae* serotypes.

15

SUMMARY OF THE INVENTION

Through the complex analysis of a large number of polymorphisms which exist between at least 132 molecular capsular sequence types of *Streptococcus pneumoniae* the present inventors have devised methods which can be used to distinguish between a
20 majority of different *S. pneumoniae* serotypes. In particular, prior art methods of nucleic acid based typing techniques could serotype only about 20 serotypes of *S. pneumoniae*. In contrast, the methods of the invention can be used to serotype most of the about 90 serotypes of *S. pneumoniae*. The methods of the invention can also be used to subtype some serotypes.

25 Thus, in a first aspect, the present invention provides a method of distinguishing between at least 25 different serotypes of *Streptococcus pneumoniae* in a sample, the method comprising,

- i) analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, and/or
30 ii) analysing at least a portion of the *wzy* and/or *wzx* gene(s).

Preferably, the method can be used to type at least 40, more preferably at least 50, more preferably at least 70, more preferably at least 90, more preferably at least 100, even more preferably at least about 132 different molecular capsular sequence types of *S. pneumoniae*.

35 The present inventors are the first to provide suitable nucleic acid based techniques for typing a large number of *Streptococcus pneumoniae* serotypes.

Accordingly, in another aspect the present invention provides a method of determining the serotype of *Streptococcus pneumoniae* in a sample, the method comprising,

i) analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, and/or

- 5 ii) analysing at least a portion of the *wzy* and/or *wzx* gene(s),
wherein the serotype is selected from the group consisting of: 2, 7A, 7B, 7C, 9A, 9L, 10F, 10A, 10B, 10C, 11F, 11A, 11B, 11C, 11D, 12F, 12A, 12B, 13, 15F, 15A, 15B, 15C, 16A, 17F, 17A, 18F, 18A, 18B, 21, 22F, 22A, 24F, 24A, 24B, 25F, 25A, 27, 28F, 28A, 31, 32F, 32A, 33F, 33A, 33B, 33C, 33D, 34, 35A, 35B, 35C, 36, 37, 38, 39, 40,
10 41F, 41A, 42, 43, 44, 45, 46, 47, 47A and 48.

The present inventors have surprisingly found that at least about 102 molecular capsular sequence types of *S. pneumoniae* can be directly serotyped by analysing the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene of the *S. pneumoniae* genome.

- Thus, in another aspect the present invention provides a method of determining
15 the serotype of *Streptococcus pneumoniae* in a sample, the method comprising analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene.

- In a preferred embodiment, the portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene which is analysed is any
20 nucleotide which is polymorphic between at least some of the *S. pneumoniae* serotypes referred to in Figure 2.

- In a particularly preferred embodiment, the method comprises amplifying at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, and sequencing the amplification product. More preferably,
25 the entire approximate 800 bp region as provided in Figure 2 is amplified and sequenced.

- In the case of sequencing to identify the serotype, the sequencing primers are selected such that they hybridise specifically to a region within or near to a region within which a polymorphism is present. The primers need not be specific to particular
30 serotypes since it is the actual sequence information obtained during the sequencing process which is used to determine the *S. pneumoniae* serotype. Thus the primers may hybridise specifically to genomic DNA from all *S. pneumoniae* serotypes (or at least those serotypes referred to in Figure 2), or to genomic DNA from some, but not all, *S. pneumoniae* serotypes.

- 35 When a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene is amplified, it is preferable that the amplification is

performed using primer pairs comprising a sequence selected from the group consisting of:

- 1) GGCATT(/C)TATGGAGTTGATTCG(/A)TCCATT(/C)CACAC(C/T)TTAG
(SEQ ID NO:68) and
5 GC(/T)TCAATG(/A)TGG(/A)GCAATG(/T)ACTGGA(/C)GTA(/G)ATTCCCA(/G)A
CATC (SEQ ID NO:73) ,
- 2) GGCATT(/C)TATGGAGTTGATTCG(/A)TCCATT(/C)CACACC(T)
TTAG (SEQ ID NO:68) and
CCATCAC(T)ATAGAGGTTAC(/A)TG(/A)TCTGGCATT(/C)GC (SEQ ID NO:71),
- 10 3) GAAAGTGGG(/A/T)GGG(/A/T)A(/G)A(/C)T(/G)TAT(/C)AAAGTA(/G)
AATTCT(/G)CAAGAT(/C)TTA(/G)AAA(/G)G (SEQ ID NO:70) and
T(/G)CATG(/A)CTA(/G)AAC(T)TCT(/A)ATC(/T)AAG(/A)GCATAACGACTATC(/
T) (SEQ ID NO:72), and
- 15 4) primer pairs that amplify the same region, or diagnostic portion thereof, from
the genome of a strain of *S. pneumoniae* as the primers provided in 1) to 3).

In an alternate embodiment, the nucleotide sequence analysis step comprises determining whether a polynucleotide obtained from *S. pneumoniae* selectively hybridises to a polynucleotide probe comprising one or more polymorphic regions of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, wherein such polymorphic regions are shown in Figure 2. More preferably, the nucleotide sequence analysis step comprises a plurality of said polynucleotide probes. In a particularly preferred embodiment, where hybridisation to a plurality of probes is used as a means of analysis, the plurality of polynucleotide probes are present as a microarray.

25 It has been noted that the method of analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene does not enable the identification of all known *S. pneumoniae* serotypes, for example shared sequences were noted in the following cases; 6A and 6B; 10A and 17A, 10A and 23F, 23F and 23A; 15B, 15C, 22F and 22A; 17F, 35B, 35C and 42. Accordingly, in these
30 instances further analysis will need to be performed to determine the correct serotype. To this end, the present inventors have discovered that polymorphisms in the *wzy* and/or *wzx* genes can also be useful for *S. pneumoniae* serotyping.

Accordingly, in a further aspect the present invention provides a method of determining the serotype of *Streptococcus pneumoniae* in a sample, the method
35 comprising analysing at least a portion of the *wzy* and/or *wzx* gene(s).

In a preferred embodiment, the method comprises amplifying at least a portion of the *wzy* and/or *wzx* gene(s), and determining the length of the amplification product.

In a particularly preferred embodiment, at least a portion of the *wzy* and/or *wzx* gene(s) is amplified using primer pairs comprising a sequence selected from the group consisting of:

- 1) GTAGGTGTAGTTTTTCAGGGACTTTAATTTTATGCAGTG (SEQ ID NO:74) and
TCGCTTAACACAATGGCTTTAGAAGGTAGAG (SEQ ID NO:75),

32) GATCATACTCCCTATCATTACGACTCCCTATGTAACG (SEQ ID NO:137) and CCAAGAAATATCCAAACCTTTTGACACTAACTTAATCC (SEQ ID NO:138),

33) GTTGTTTTAGCTCAAGGAGGGATAATGTTGGCTTCG (SEQ ID NO:136) and GCTGATTTTACAAATAGGAAAATAGAGATTGCACCAAC (SEQ ID NO:139), and

34) a primer comprising a sequence selected from any one of SEQ ID NO's 144 to 333, and

35) a primer that can be used to amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as a primer provided as any one of SEQ ID NO's 75 to 139 or 144 to 333.

Guidance regarding the serotypes these primer pairs target, and the length of
5 resulting amplification products, is provided in Tables 2, 3 and 7.

It has been noted that some of the above primer pairs formed non-serotype specific amplicons, for example; PCR targeting serotype 6B also amplified 6A; PCR targeting 18C amplified all serotypes in serogroup 18; PCR targeting *wzx* (but not *wzy*) of serotype 23F, amplified three serotype 23A strains; PCR targeting *wzx* and *wzy* of
10 serotypes 33/37 amplified a 33A isolate and that targeting *wzx* amplified a serotype 33B isolate. Accordingly, in these instances further analysis will need to be performed to determine the correct serotype. For instance, traditional serological typing can be performed.

Serotype 3 does not contain *wzy* and *wzx* genes. Accordingly, upon obtaining
15 results using the method of analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, the presence of serotype 3 can be confirmed by analysing the *orf2 (wze)-cap3A-cap3B* region. Preferably, serotype 3 is identified by amplifying a portion of the *orf2 (wze)-cap3A-cap3B* region using primer pairs selected from the group consisting of:

20 1) GCACAAAAAAAAGTTTGATATTCCTTGACAATAG (SEQ ID NO:140) and GCAGGATCTAAGGAGGCTTCAAGATTCAACTC (SEQ ID NO:141),

2) CGAACCTACTATTGAGTGTGATACTTTTATGGGATACAGAG (SEQ ID NO:142) and CTGACAGCATGAAAATATATAACCGCCCAACGAATAAG
25 (SEQ ID NO:143), and

3) primer pairs that amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as the primers provided in 1) or 2).

During routine analysis of a sample comprising bacteria it will typically be desirable to ensure that the sample being analysed actually contains *Streptococcus pneumoniae*. Thus, it is preferred that the methods of the present invention include
30 detecting any serotype of *Streptococcus pneumoniae* in the sample.

Such methods are known in the art and include, but are not limited to, amplifying portions of the *psaA* and/or pneumolysin genes followed by detection of the amplification products.

35 In a preferred embodiment, a portion of the *psaA* gene is amplified using primers comprising the sequence

TACATTACTCGTTCTCTTTCTTTCTGCAATCATTCTTG (SEQ ID NO:64) and TAGTAGCTGTCGCCTTCTTTACCTTGTTCTGC (SEQ ID NO:65), or primer pairs that amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as SEQ ID NO:64 and SEQ ID NO:65. In another preferred
 5 embodiment, a portion of the pneumolysin gene is amplified using primers comprising the sequence AGAATAATCCCACTCTTCTTGCGGTTGA (SEQ ID NO:66) and CATGCTGTGAGCCGTTATTTTTTCATACTG (SEQ ID NO:67) or primer pairs that amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as SEQ ID NO:66 and SEQ ID NO:67.

10 The present inventors have observed a strong correlation between the molecular capsular sequence typing techniques of the invention and the actual serotype of a strain as determined by traditional antibody based serological typing. However, the typing methods of the invention may be assisted by further serotyping the *S. pneumoniae* strain. For instance, to ensure recombination events have not occurred, upon typing
 15 with the methods of the invention the serotype can be confirmed by serologically typing for the strain suggested by the methods of the invention. Furthermore, the inventors have noted that a few serotypes are difficult to resolve using the methods of the invention, for example; 6A and 6B; 15B and 15C; 22F and 22A; and 35C and 42. Upon identification of any of these serotypes by the molecular techniques of the
 20 invention the serotype can be unequivocally typed using traditional serological methods.

In another aspect, the present invention provides an isolated polynucleotide comprising a sequence of nucleotides selected from those provided as SEQ ID NO's 2 to 63, or a fragment thereof which is at least 10 nucleotides in length, with the proviso
 25 that the polynucleotide does not comprise the entire *wzy* and/or *wzx* gene(s) of a *S. pneumoniae* serotype selected from the group consisting of: 1, 2, 4, 6A, 6B, 8, 9V, 14, 18C, 19F, 19A, 19B, 23F, 33F and 37, or the entire *wzx* gene of *S. pneumoniae* serotype 19C.

In a further aspect, the present invention provides an isolated polynucleotide
 30 comprising a sequence of nucleotides selected from the group consisting of: 1-AF532632, 10A-AF532633, 10A-AF532634, 10B-AY508586, 10F-AF532635, 10F-AF532636, 10F-AY508587, 11A-AF532637, 11A-AF532638, 11B-AF532639, 11C-AY508588, 11C-AY508589, 12A-AY508590, 12A-AY508591, 12F-AF532640, 12F-AF532641, 13-AF532642, 14-AF532643, 14-AF532644, 14-AF532645, 15A-
 35 AF532646, 15A-AF532647, 15B-AF532648, 15B-AF532649, 15B-AF532650, 15C-AF532651, 15C-AF532652, 15C-AY330714, 15C-AY330715, 15C-AY508592, 15C-

AY508593, 15F-AY508594, 15F-AY508595, 16A-AY508596, 16F-AF532653, 16F-AF532654, 17A-AF532655, 17A-AY508597, 17F-AF532656, 17F-AF532657, 18A-AF532658, 18A-AF532659, 18B-AF532660, 18C-AF532661, 18F-AF532662, 18F-AY330716, 18F-AY508598, 19A-AF532663, 19A-AF532664, 19B-AY508599, 19C-AY508600, 19C-AY508601, 19F-AF532665, 19F-AF532666, 19F-AF532667, 19F-AF532668, 2-AF532669, 20-AF532670, 21-AF532671, 21-AY508602, 22A-AF532672, 22F-AF532673, 23A-AF532674, 23A-AF532675, 23B-AF532676, 23B-AY330717, 23F-AF532677, 23F-AF532678, 23 F-AF532679, 24A-AY508603, 24B-AY508604, 24F-AY508605, 24F-AY508606, 24F-AY508607, 25F-AF532711, 27-AY508608, 28A-AY508609, 28F-AY508610, 28F-AY508611, 29-AF532680, 29-AY330718, 3-AF532681, 3-AF532682, 3-AF532683, 31-AF532684, 32A-AY508612, 32A-AY508613, 32F-AY508614, 33A-AF532685, 33B-AF532686, 33B-AY508615, 33C-AY508616, 33F-AF532687, 33F-AF532688, 33F-AF532689, 34-AF532690, 35A-AY508617, 35B-AF532691, 35C-AY508618, 35F-AF532692, 36-AY508619, 37-AF532713, 38-AF532712, 39-AY508620, 39-AY508621, 4-AF532693, 40-AY508622, 41A-AY508623, 41F-AY508624, 42-AY508625, 43-AY508626, 45-AY508628, 46-AY508629, 47A-AY508630, 47F-AY508631, 48-AY508632, 48-AY508633, 5-AF532696, 5-AF532697, 5-AY508634, 6A-AF532698, 6A-AF532699, 6A-AF532700, 6A-AF532701, 6A-AF532702, 6A-AY508641, 6B-AF532703, 6B-AF532704, 6B-AF532705, 7A-AY508635, 7B-AY508636, 7C-AF532706, 7F-AF532707, 8-AF532708, 9A-AY508637, 9L-AY508638, 9N-AF532709, 9V-AF532710 and 9V-AY508639 as provided in Figure 2, or a fragment thereof which is at least 10 nucleotides in length, with the proviso the polynucleotide does not comprise the 3' end of the *cpsA* gene to the 5' end of the *cpsB* gene of a *S. pneumoniae* serotype selected from the group consisting of: 1, 2, 3, 4, 6A, 6B, 8, 9V, 14, 18C, 19F, 19A, 23F, 33F and 37.

In a preferred embodiment, the polynucleotide of these aspects is at least 15 nucleotides, more preferably at least 20 nucleotides, more preferably at least 25 nucleotides, more preferably at least 30 nucleotides, more preferably at least 50 nucleotides in length, and even more preferably at least 100 nucleotides in length.

In a further aspect, the present invention provides an isolated polynucleotide consisting essentially of 10 to 50 contiguous nucleotides corresponding to a portion of the 3' end of the *cpsA* *S. pneumoniae* gene or the 5' end of the *cpsB* *S. pneumoniae* gene.

In a further aspect, the present invention provides a polynucleotide consisting essentially of 10 to 50 contiguous nucleotides corresponding to a portion of the *S. pneumoniae* *wzy* and/or *wzx* gene(s).

Preferably, said polynucleotide of 10 to 50 contiguous nucleotides comprises
5 one or more nucleotides which differ between different *S. pneumoniae* serotypes.

Polynucleotides of 10 to 50 contiguous nucleotides can be used as amplification primers, or as probes, for the identification of different *S. pneumoniae* serotypes.

Preferably the nucleotides which differ between *S. pneumoniae* serotypes correspond to one or more of positions as shown in Figure 2.

10 Preferably, the polynucleotide is detectably labelled. The label can be any suitable label known in the art including, but not limited to, radionuclides, enzymes, fluorescent, and chemiluminescent labels.

Also provided is a vector comprising a polynucleotide of the invention. Preferably, the vector is an expression vector. Furthermore, provided is a host cell
15 comprising a vector of the invention. Suitable vectors and host cells would be well known to those skilled in the art.

In yet another aspect, the present invention provides a composition comprising a plurality of polynucleotides according to the invention and an acceptable carrier or excipient. Preferably, the carrier or excipient is water or a suitable buffer. The
20 composition may be used in methods of typing different *S. pneumoniae* serotypes.

In a further aspect the present invention provides a microarray comprising a plurality of polynucleotides according to the invention. The microarray may be used in methods of typing different *S. pneumoniae* serotypes.

In another aspect, the present invention provides a kit comprising at least one
25 polynucleotide of the present invention.

Preferably, the polynucleotide is 10 to 50 nucleotides in length. In one embodiment, the kit further comprises reagents necessary for nucleic acid amplification. In another embodiment, the polynucleotide is detectably labelled and the kit further comprises means for detecting the labelled polynucleotide.

30 As will be apparent, preferred features and characteristics of one aspect of the invention are applicable to many other aspects of the invention.

Throughout this specification the word "comprise", or variations such as "comprises" or "comprising", will be understood to imply the inclusion of a stated element, integer or step, or group of elements, integers or steps, but not the exclusion of
35 any other element, integer or step, or group of elements, integers or steps.

The invention is hereinafter described by way of the following non-limiting examples and with reference to the accompanying figures.

BRIEF DESCRIPTION OF THE ACCOMPANYING DRAWINGS

5 Figure 1. The genomic sequence of *cpsA* (*wzg*) and *cpsB* (*wzh*) genes of serotype 4 of *S. pneumoniae* as published by Jiang et al. (2001) and deposited as GenBank Accession Number AF316639. The remaining 3' sequence of GenBank Accession Number AF316639 has not been provided. Nucleotides 1520 to 2965 encode *cpsA* whilst nucleotides 2967 to 3698 encode *cpsB*.

10

Figure 2. Multiple sequence alignments for the region between the 3'-end of *cpsA* (*wzg*) and the 5'-end of *cpsB* (*wzh*) of 132 molecular capsular sequence types of *S. pneumoniae*. The alignment numbering start point "1" refer to the position "2470" of *S. pneumoniae* serotype 4 *cpsA* (*wzg*) gene (GenBank accession number: AF316639) (Figure 1).

15

Figure 3. Phylogenetic tree inferred from sequences in the region between the 3'-end of *cpsA* (*wzg*) and the 5'-end of *cpsB* (*wzh*) genes for 132 molecular capsular sequence types of *S. pneumoniae*. Most of the tree input sequences are from Figure 2; for GenBank accession numbers see Tables 1 and 8.

20

Figure 4. Phylogenetic tree of *wzx* genes of 83 *S. pneumoniae cps* serotypes. The tree is generated by the neighbour-joining method based on all nucleotide sites.

25 Figure 5. Phylogenetic tree of *wzy* genes of total 83 *S. pneumoniae cps* serotypes. The tree is generated by the neighbour-joining method based on all nucleotide sites.

Figure 6. Schematic representation of the closely related *wzx* genes. Each block represents *wzx* genes from one or more *S. pneumoniae* serotype *cps* gene cluster. Similar patterns and shading represent regions with DNA sequence identity > 75% among different nucleotide sequences.

30

KEY TO THE SEQUENCE LISTING

SEQ ID NO:1 - Genomic sequence of *cpsA* (*wzg*) and *cpsB* (*wzh*) genes of serotype 4 of *S. pneumoniae* (Figure 1).

35

SEQ ID NO:2 - Partial sequence of strain 00-251-3185 *wzx* gene.

- SEQ ID NO:3 - Partial sequence of strain 01-122-0226 *wzx* gene.
SEQ ID NO:4 - Partial sequence of strain 01-192-2471 *wzx* gene.
SEQ ID NO:5 - Partial sequence of strain MA055100 *wzx* gene.
SEQ ID NO:6 - Partial sequence of strain NZSPN01/329 *wzx* gene.
5 SEQ ID NO:7 - Partial sequence of strain 00-256-1986 *wzx* gene.
SEQ ID NO:8 - Partial sequence of strain NZSPN01/276 *wzx* gene.
SEQ ID NO:9 - Partial sequence of strain 00-201-1422 *wzx* gene.
SEQ ID NO:10 - Partial sequence of strain 00-211-1669 *wzx* gene.
SEQ ID NO:11 - Partial sequence of strain 00S002 *wzx* gene.
10 SEQ ID NO:12 - Partial sequence of strain 00-251-3185 *wzy* gene.
SEQ ID NO:13 - Partial sequence of strain 01-122-0226 *wzy* gene.
SEQ ID NO:14 - Partial sequence of strain 01-192-2471 *wzy* gene.
SEQ ID NO:15 - Partial sequence of strain MA055100 *wzy* gene.
SEQ ID NO:16 - Partial sequence of strain NZSPN01/329 *wzy* gene.
15 SEQ ID NO:17 - Partial sequence of strain 00-256-1986 *wzy* gene.
SEQ ID NO:18 - Partial sequence of strain NZSPN01/276 *wzy* gene.
SEQ ID NO:19 - Partial sequence of strain 00-201-1422 *wzy* gene.
SEQ ID NO:20 - Partial sequence of strain 00-211-1669 *wzy* gene.
SEQ ID NO:21 - Partial sequence of strain 00S002 *wzy* gene.
20 SEQ ID NO:22 - Partial sequence of strain NZSPN01/509 *cpsI* and *wzx* genes.
SEQ ID NO:23 - Partial sequence of strain MA050408 *cpsI* and *wzx* genes.
SEQ ID NO:24 - Partial sequence of strain MA052433 *cpsI* and *wzx* genes.
SEQ ID NO:25 - Partial sequence of strain 00S009 *cpsI* and *wzx* genes.
SEQ ID NO:26 - Partial sequence of strain 99-325-0373 *cpsI* and *wzx* genes.
25 SEQ ID NO:27 - Partial sequence of strain NZSPN00/454 *cpsI* and *wzx* genes.
SEQ ID NO:28 - Partial sequence of strain NZSPN00/484 *cpsI* and *wzx* genes.
SEQ ID NO:29 - Partial sequence of strain 00-081-2291 *wzy* and *wzx* genes.
SEQ ID NO:30 - Partial sequence of strain 00S168 *wzy* and *wzx* genes.
SEQ ID NO:31 - Partial sequence of strain 00-280-1493 *wzy* and *wzx* genes.
30 SEQ ID NO:32 - Partial sequence of strain MA063073 *wzy* and *wzx* genes.
SEQ ID NO:33 - Partial sequence of strain NZSPN00/410 *wzy* and *wzx* genes.
SEQ ID NO:34 - Partial sequence of strain NZSPN01/243 *wzy* and *wzx* genes.
SEQ ID NO:35 - Partial sequence of strain MA063087 *wzy* and *wzx* genes.
SEQ ID NO:36 - Partial sequence of strain MA063207 *wzy* and *wzx* genes.
35 SEQ ID NO:37 - Partial sequence of strain 01S333 *wzx* gene.
SEQ ID NO:38 - Partial sequence of strain MA050663 *wciW* and *wzx* genes.

- SEQ ID NO:39 - Partial sequence of strain 01S319 *wciW* and *wzx* genes.
SEQ ID NO:40 - Partial sequence of strain NZSPN00/353 *wciW* and *wzx* genes.
SEQ ID NO:41 - Partial sequence of strain MA062610 *wciW* and *wzx* genes.
SEQ ID NO:42 - Partial sequence of strain MA053392 *wciW* and *wzx* genes.
5 SEQ ID NO:43 - Partial sequence of strain NZSPN00/319 *wciW* and *wzx* genes.
SEQ ID NO:44 - Partial sequence of strain NZSPN01/278 *wciW* and *wzx* genes.
SEQ ID NO:45 - Partial sequence of strain 01S009 *wciW* and *wzx* genes.
SEQ ID NO:46 - Partial sequence of strain MA052628 *wciW* and *wzx* genes.
SEQ ID NO:47 - Partial sequence of strain 00-081-2291 *cpsJ* and *wzy* genes.
10 SEQ ID NO:48 - Partial sequence of strain 00-280-1493 *cpsJ* and *wzy* genes.
SEQ ID NO:49 - Partial sequence of strain NZSPN00/410 *cpsJ* and *wzy* genes.
SEQ ID NO:50 - Partial sequence of strain NZSPN01/243 *cpsJ* and *wzy* genes.
SEQ ID NO:51 - Partial sequence of strain MA063073 *cpsJ* and *wzy* genes.
SEQ ID NO:52 - Partial sequence of strain 00S168 *cpsJ* and *wzy* genes.
15 SEQ ID NO:53 - Partial sequence of strain MA063087 *cpsJ* and *wzy* genes.
SEQ ID NO:54 - Partial sequence of strain MA063207 *cpsJ* and *wzy* genes.
SEQ ID NO:55 - Partial sequence of strain 01S319 *wzx* and *wzy* genes.
SEQ ID NO:56 - Partial sequence of strain NZSPN00/353 *wzx* and *wzy* genes.
SEQ ID NO:57 - Partial sequence of strain MA062610 *wzx* and *wzy* genes.
20 SEQ ID NO:58 - Partial sequence of strain MA053392 *wzx* and *wzy* genes.
SEQ ID NO:59 - Partial sequence of strain NZSPN00/319 *wzx* and *wzy* genes.
SEQ ID NO:60 - Partial sequence of strain NZSPN01/278 *wzx* and *wzy* genes.
SEQ ID NO:61 - Partial sequence of strain MA050663 *wzx* and *wzy* genes.
SEQ ID NO:62 - Partial sequence of strain MA052628 *wzx* and *wzy* genes.
25 SEQ ID NO:63 - Partial sequence of strain 01S009 *wzx* and *wzy* genes.
SEQ ID NO's 64 to 143 - Oligonucleotide primers provided in Table 2.
SEQ ID NO's 144 to 333 - Oligonucleotide primers provided in Table 7.
SEQ ID NO:334* - Sequence of serotype 33C *wzx* gene.
SEQ ID NO:335* - Sequence of serotype 10B *wzx* gene.
30 SEQ ID NO:336* - Sequence of serotype 10C *wzx* gene.
SEQ ID NO:337* - Sequence of serotype 10F *wzx* gene.
SEQ ID NO:338* - Sequence of serotype 11A *wzx* gene.
SEQ ID NO:339* - Sequence of serotype 11D *wzx* gene.
SEQ ID NO:340* - Sequence of serotype 12A *wzx* gene.
35 SEQ ID NO:341* - Sequence of serotype 12B *wzx* gene.
SEQ ID NO:342* - Sequence of serotype 12F *wzx* gene.

- SEQ ID NO:343* - Sequence of serotype 13 *wzx* gene.
SEQ ID NO:344* - Sequence of serotype 14 *wzx* gene.
SEQ ID NO:345* - Sequence of serotype 15A *wzx* gene.
SEQ ID NO:346* - Sequence of serotype 15B *wzx* gene.
5 SEQ ID NO:347* - Sequence of serotype 15C *wzx* gene.
SEQ ID NO:348* - Sequence of serotype 15F *wzx* gene.
SEQ ID NO:349* - Sequence of serotype 16A *wzx* gene.
SEQ ID NO:350* - Sequence of serotype 16F *wzx* gene.
SEQ ID NO:351* - Sequence of serotype 17A *wzx* gene.
10 SEQ ID NO:352* - Sequence of serotype 17F *wzx* gene.
SEQ ID NO:353* - Sequence of serotype 18A *wzx* gene.
SEQ ID NO:354* - Sequence of serotype 18B *wzx* gene.
SEQ ID NO:355* - Sequence of serotype 18F *wzx* gene.
SEQ ID NO:356* - Sequence of serotype 20 *wzx* gene.
15 SEQ ID NO:357* - Sequence of serotype 22A *wzx* gene.
SEQ ID NO:358* - Sequence of serotype 22F *wzx* gene.
SEQ ID NO:359* - Sequence of serotype 23A *wzx* gene.
SEQ ID NO:360* - Sequence of serotype 23B *wzx* gene.
SEQ ID NO:361* - Sequence of serotype 24B *wzx* gene.
20 SEQ ID NO:362* - Sequence of serotype 25A *wzx* gene.
SEQ ID NO:363* - Sequence of serotype 25F *wzx* gene.
SEQ ID NO:364* - Sequence of serotype 27 *wzx* gene.
SEQ ID NO:365* - Sequence of serotype 28A *wzx* gene.
SEQ ID NO:366* - Sequence of serotype 28F *wzx* gene.
25 SEQ ID NO:367* - Sequence of serotype 29 *wzx* gene.
SEQ ID NO:368* - Sequence of serotype 31 *wzx* gene.
SEQ ID NO:369* - Sequence of serotype 32A *wzx* gene.
SEQ ID NO:370* - Sequence of serotype 32F *wzx* gene.
SEQ ID NO:371* - Sequence of serotype 33A *wzx* gene.
30 SEQ ID NO:372* - Sequence of serotype 33B *wzx* gene.
SEQ ID NO:373* - Sequence of serotype 10A *wzx* gene.
SEQ ID NO:374* - Sequence of serotype 9N *wzx* gene.
SEQ ID NO:375* - Sequence of serotype 34 *wzx* gene.
SEQ ID NO:376* - Sequence of serotype 35A *wzx* gene.
35 SEQ ID NO:377* - Sequence of serotype 35B *wzx* gene.
SEQ ID NO:378* - Sequence of serotype 35C *wzx* gene.

- SEQ ID NO:379* - Sequence of serotype 35F *wzx* gene.
SEQ ID NO:380* - Sequence of serotype 36 *wzx* gene.
SEQ ID NO:381* - Sequence of serotype 38 *wzx* gene.
SEQ ID NO:382* - Sequence of serotype 39 *wzx* gene.
5 SEQ ID NO:383* - Sequence of serotype 40 *wzx* gene.
SEQ ID NO:384* - Sequence of serotype 41A *wzx* gene.
SEQ ID NO:385* - Sequence of serotype 41F *wzx* gene.
SEQ ID NO:386* - Sequence of serotype 42 *wzx* gene.
SEQ ID NO:387* - Sequence of serotype 43 *wzx* gene.
10 SEQ ID NO:388* - Sequence of serotype 44 *wzx* gene.
SEQ ID NO:389* - Sequence of serotype 45 *wzx* gene.
SEQ ID NO:390* - Sequence of serotype 46 *wzx* gene.
SEQ ID NO:391* - Sequence of serotype 47A *wzx* gene.
SEQ ID NO:392* - Sequence of serotype 47F *wzx* gene.
15 SEQ ID NO:393* - Sequence of serotype 48 *wzx* gene.
SEQ ID NO:394* - Sequence of serotype 48(1) *wzx* gene.
SEQ ID NO:395* - Sequence of serotype 7A *wzx* gene.
SEQ ID NO:396* - Sequence of serotype 7C *wzx* gene.
SEQ ID NO:397* - Sequence of serotype 7F *wzx* gene.
20 SEQ ID NO:398* - Sequence of serotype 9A *wzx* gene.
SEQ ID NO:399* - Sequence of serotype 9L *wzx* gene.
SEQ ID NO:400* - Sequence of serotype 33D *wzx* gene.
SEQ ID NO:401* - Sequence of serotype 33B *wzy* gene.
SEQ ID NO:402* - Sequence of serotype 10B *wzy* gene.
25 SEQ ID NO:403* - Sequence of serotype 10C *wzy* gene.
SEQ ID NO:404* - Sequence of serotype 10F *wzy* gene.
SEQ ID NO:405* - Sequence of serotype 11A *wzy* gene.
SEQ ID NO:406* - Sequence of serotype 11D *wzy* gene.
SEQ ID NO:407* - Sequence of serotype 12A *wzy* gene.
30 SEQ ID NO:408* - Sequence of serotype 12B *wzy* gene.
SEQ ID NO:409* - Sequence of serotype 12F *wzy* gene.
SEQ ID NO:410* - Sequence of serotype 13 *wzy* gene.
SEQ ID NO:411* - Sequence of serotype 14 *wzy* gene.
SEQ ID NO:412* - Sequence of serotype 15A *wzy* gene.
35 SEQ ID NO:413* - Sequence of serotype 15B *wzy* gene.
SEQ ID NO:414* - Sequence of serotype 15C *wzy* gene.

- SEQ ID NO:415* - Sequence of serotype 15F *wzy* gene.
SEQ ID NO:416* - Sequence of serotype 16A *wzy* gene.
SEQ ID NO:417* - Sequence of serotype 16F *wzy* gene.
SEQ ID NO:418* - Sequence of serotype 17A *wzy* gene.
5 SEQ ID NO:419* - Sequence of serotype 17F *wzy* gene.
SEQ ID NO:420* - Sequence of serotype 18A *wzy* gene.
SEQ ID NO:421* - Sequence of serotype 18B *wzy* gene.
SEQ ID NO:422* - Sequence of serotype 18F *wzy* gene.
SEQ ID NO:423* - Sequence of serotype 19C *wzy* gene.
10 SEQ ID NO:424* - Sequence of serotype 20 *wzy* gene.
SEQ ID NO:425* - Sequence of serotype 22A *wzy* gene.
SEQ ID NO:426* - Sequence of serotype 22F *wzy* gene.
SEQ ID NO:427* - Sequence of serotype 23A *wzy* gene.
SEQ ID NO:428* - Sequence of serotype 23B *wzy* gene.
15 SEQ ID NO:429* - Sequence of serotype 24B *wzy* gene.
SEQ ID NO:430* - Sequence of serotype 25A *wzy* gene.
SEQ ID NO:431* - Sequence of serotype 25F *wzy* gene.
SEQ ID NO:432* - Sequence of serotype 27 *wzy* gene.
SEQ ID NO:433* - Sequence of serotype 28A *wzy* gene.
20 SEQ ID NO:434* - Sequence of seotype 28F *wzy* gene.
SEQ ID NO:435* - Sequence of serotype 29 *wzy* gene.
SEQ ID NO:436* - Sequence of serotype 31 *wzy* gene.
SEQ ID NO:437* - Sequence of serotype 32A *wzy* gene.
SEQ ID NO:438* - Sequence of serotype 32F *wzy* gene.
25 SEQ ID NO:439* - Sequence of serotype 33A *wzy* gene.
SEQ ID NO:440* - Sequence of serotype 10A *wzy* gene.
SEQ ID NO:441* - Sequence of serotype 9N *wzy* gene.
SEQ ID NO:442* - Sequence of serotype 33D *wzy* gene.
SEQ ID NO:443* - Sequence of serotype 34 *wzy* gene.
30 SEQ ID NO:444* - Sequence of serotype 35A *wzy* gene.
SEQ ID NO:445* - Sequence of serotype 35B *wzy* gene.
SEQ ID NO:446* - Sequence of serotype 35C *wzy* gene.
SEQ ID NO:447* - Sequence of serotype 35F *wzy* gene.
SEQ ID NO:448* - Sequence of serotype 36 *wzy* gene.
35 SEQ ID NO:449* - Sequence of serotype 38 *wzy* gene.
SEQ ID NO:450* - Sequence of serotype 39 *wzy* gene.

- SEQ ID NO:451* - Sequence of serotype 40 *wzy* gene.

DETAILED DESCRIPTION OF THE INVENTION

30 Definitions

Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art (e.g., in cell culture, molecular genetics, nucleic acid chemistry, hybridization techniques and biochemistry).

- 35 As used herein, the term "nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene" at least refers to the region spanning from

nucleotide 2470 to nucleotide 3268 of Figure 1. Figure 1 provides the genomic sequence of *cpsA* (*wzg*) and *cpsB* (*wzh*) genes of serotype 4 as published by Jiang et al. (2001) and submitted as GenBank Accession Number AF316639. As the skilled addressee would be aware, the same region from other serotypes of *S. pneumoniae* can be identified using standard techniques such as DNA cloning, sequencing and nucleotide sequence alignment. Such techniques are described in further detail in the Examples section. In addition, these techniques have been used to determine the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene from many different serotypes of *S. pneumoniae*, the results of which, including a consensus sequence for this region, are also provided in Figure 2.

As used herein, the term "primer pairs that amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae*", or variations thereof, refers to the capability of the skilled addressee to determine where the identified primers of the claimed invention hybridize the *S. pneumoniae* genome of a particular strain(s), and subsequent ability to design alternate primers which can be used for the same purpose as the primers defined herein. Typically, these alternate primers will hybridize the same region of the genome but be larger or smaller in size, or these alternate primers will hybridize to a region of the genome which is in close proximity, for example within 500 basepairs, to where the specifically defined primers hybridize. Naturally, the term "diagnostic portion thereof" refers to the alternate primers being capable of amplifying a portion of the region of the defined primers but still capable of amplifying enough of the region to determine the serotype of a particular *S. pneumoniae* isolate.

25 General Techniques

Unless otherwise indicated, the recombinant DNA and immunological techniques utilized in the present invention are standard procedures, well known to those skilled in the art. Such techniques are described and explained throughout the literature in sources such as, J. Perbal, A Practical Guide to Molecular Cloning, John Wiley and Sons (1984), J. Sambrook et al., Molecular Cloning: A Laboratory Manual, Cold Spring Harbour Laboratory Press (1989), T.A. Brown (editor), Essential Molecular Biology: A Practical Approach, Volumes 1 and 2, IRL Press (1991), D.M. Glover and B.D. Hames (editors), DNA Cloning: A Practical Approach, Volumes 1-4, IRL Press (1995 and 1996), and F.M. Ausubel et al. (editors), Current Protocols in Molecular Biology, Greene Pub. Associates and Wiley-Interscience (1988, including all updates until present), Ed Harlow and David Lane (editors) Antibodies: A

Laboratory Manual, Cold Spring Harbour Laboratory, (1988), and J.E. Coligan et al. (editors) Current Protocols in Immunology, John Wiley & Sons (including all updates until present), and are incorporated herein by reference.

5 Detection of Polymorphisms

Any technique known in the art can be used to detect a polymorphism described herein. Examples of such techniques include, but are not limited to, sequencing of the DNA at one or more of the relevant positions; differential hybridisation of an oligonucleotide probe designed to hybridise at the relevant positions of a particular *S. pneumoniae* serotype(s); denaturing gel electrophoresis following digestion with an appropriate restriction enzyme, preferably following amplification of the relevant DNA regions; S1 nuclease sequence analysis; non-denaturing gel electrophoresis, preferably following amplification of the relevant DNA regions; conventional RFLP (restriction fragment length polymorphism) assays; selective DNA amplification using oligonucleotides which are matched for a particular *S. pneumoniae* serotype(s) unmatched for other *S. pneumoniae* serotype(s); or the selective introduction of a restriction site using a PCR (or similar) primer matched for a particular *S. pneumoniae* serotype(s), followed by a restriction digest. As outlined above, it is preferred that the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene is characterized by DNA sequencing, whilst the analysis at least a portion of the *wzy* and/or *wzx* gene is performed by procedures involving the detection of amplification products.

In one embodiment, the informative serotyping information provided herein is adapted to produce a molecular capsular sequence typing database as generally described by Robertson et al. (2004).

PCR-based methods of detection may rely upon the use of primer pairs, at least one of which binds specifically to a region of interest in one or more, but not all, serotypes. Unless both primers bind, no PCR product will be obtained. Consequently, the presence or absence of a specific PCR product may be used to determine the presence of a sequence indicative of a specific *S. pneumoniae* serotype(s). However, as mentioned, only one primer need correspond to a region of heterogeneity in the genes/regions of interest. The other primer may bind to a conserved or heterogenous region within said gene/region or even a region within another part of the *S. pneumoniae* genome, whether said region is conserved or heterogeneous between serotypes.

Alternatively, primers that bind to conserved regions of the *S. pneumoniae* genome but which flank a region whose length varies between serotypes may be used. In this case, a PCR product will always be obtained when *S. pneumoniae* bacteria are present but the size of the PCR product varies between serotypes. Examples of such
5 varying amplification product lengths are disclosed herein in relation to the *wzy* and *wzx* genes.

Furthermore, a combination of specific binding of one or both primers and variations in the length of PCR primer may be used as a means of identifying particular molecular serotypes.

10 In some cases, PCR and other specific hybridisation- based serotyping methods will involve the use of nucleotide primers/probes which bind specifically to a region of the genome of a *S. pneumoniae* serotype which includes a nucleotide which varies between two or more serotypes. Thus the primers/probes may comprise a sequence which is complementary to one of such regions. Where positions of heterogeneity are
15 close together (for instance within 5 or so nucleotides), it may be desirable to use a primer/probe which hybridises specifically to a region of the *S. pneumoniae* genome that comprises two or more positions of heterogeneity. Such primers/probes are likely to have improved specificity and reduce the likelihood of false positives.

PCR techniques that utilize fluorescent dyes may be used in the detection
20 methods of the present invention. These include, but are not limited to, the following five techniques.

i) Fluorescent dyes can be used to detect specific PCR amplified double stranded DNA product (e.g. ethidium bromide, or SYBR Green I).

ii) The 5' nuclease (TaqMan) assay can be used which utilizes a specially
25 constructed primer whose fluorescence is quenched until it is released by the nuclease activity of the Taq DNA polymerase during extension of the PCR product.

iii) Assays based on Molecular Beacon technology can be used which rely on a specially constructed oligonucleotide that when self-hybridized quenches fluorescence (fluorescent dye and quencher molecule are adjacent). Upon hybridization to a specific
30 amplified PCR product, fluorescence is increased due to separation of the quencher from the fluorescent molecule.

iv) Assays based on Amplifluor (Intergen) technology can be used which utilize specially prepared primers, where again fluorescence is quenched due to self-hybridization. In this case, fluorescence is released during PCR amplification by
35 extension through the primer sequence, which results in the separation of fluorescent and quencher molecules.

v) Assays that rely on an increase in fluorescence resonance energy transfer can be used which utilize two specially designed adjacent primers, which have different fluorochromes on their ends. When these primers anneal to a specific PCR amplified product, the two fluorochromes are brought together. The excitation of one
5 fluorochrome results in an increase in fluorescence of the other fluorochrome.

Probes and primers may be fragments of DNA isolated from nature or may be synthetic. In one embodiment, primers/probes have a high melting temperature of $>70^{\circ}\text{C}$ so that they may be used in rapid cycle PCR. Preferably, the primers/probes comprise at least 10, 15 or 20 nucleotides. Typically, primers/probes consist of fewer
10 than 50 or 30 nucleotides. Primers/probes are generally polynucleotides comprising deoxynucleotides. They may also be polynucleotides which include within them synthetic or modified nucleotides. A number of different types of modification to oligonucleotides are known in the art. These include methylphosphonate and phosphorothioate backbones, addition of acridine or polylysine chains at the 3' and/or 5'
15 ends of the molecule. For the purposes of the present invention, it is to be understood that the polynucleotides described herein may be modified by any method available in the art. Primers/probes may be labelled with any suitable detectable label such as radioactive atoms, fluorescent molecules or biotin.

The primers be synthesized using techniques which are well known in the art.
20 Generally, the primers can be made using synthesizing machines which are commercially available.

If required, in order to facilitate subsequent cloning of amplified sequences, primers may have restriction enzyme sites appended to their 5' ends. Thus, all nucleotides of the primers are derived from the gene sequence of interest or sequences
25 adjacent to that gene except the few nucleotides necessary to form a restriction enzyme site. Such enzymes and sites are well known in the art.

A sample to be typed for the presence and/or identification of a *S. pneumoniae* serotype may be from a bacterial culture or a clinical sample from a patient, typically a human patient. Clinical samples may be cultured to produce a bacterial culture.
30 However, it is also possible to test clinical samples directly with a culturing step.

The methods of the present invention can be used in a multi-step serotyping strategy. An example of such a multi-step serotyping strategy (algorithm) is shown in Table 6. However, a variety of other strategies are envisaged and can be designed by the skilled person using the sequence heterogeneity information presented herein. In
35 particular, it is preferred that the serotyping procedure comprise at least one analysis step based on analysing one or regions between the 3' end of the *cpsA* gene and the 5'

end of the *cpsB* gene. This analysis may optionally be combined with an analysis of one or more regions within the *wzy* and/or *wzx* genes.

Microarrays

- 5 Analysis of *S. pneumoniae* genomic sequences using the above techniques may take place in solution followed by standard resolution using methods such as gel electrophoresis. However in a preferred aspect of the invention, the primers/probes are immobilised onto a solid substrate to form arrays.

10 The polynucleotide probes are typically immobilised onto or in discrete regions of a solid substrate. The substrate may be porous to allow immobilisation within the substrate or substantially non-porous, in which case the probes are typically immobilised on the surface of the substrate. Examples of suitable solid substrates include flat glass (such as borosilicate glass), silicon wafers, mica, ceramics and organic polymers such as plastics, including polystyrene and polymethacrylate. It may
15 also be possible to use semi-permeable membranes such as nitrocellulose or nylon membranes, which are widely available. The semi-permeable membranes may be mounted on a more robust solid surface such as glass. The surfaces may optionally be coated with a layer of metal, such as gold, platinum or other transition metal.

20 Preferably, the solid substrate is generally a material having a rigid or semi-rigid surface. In preferred embodiments, at least one surface of the substrate will be substantially flat, although in some embodiments it may be desirable to physically separate synthesis regions for different polymers with, for example, raised regions or etched trenches. It is also preferred that the solid substrate is suitable for the high density application of DNA sequences in discrete areas of typically from 50 to 100 μm ,
25 giving a density of 10000 to 40000 cm^{-2} .

30 The solid substrate is conveniently divided up into sections. This may be achieved by techniques such as photoetching, or by the application of hydrophobic inks, for example teflon-based inks (Cel-line, USA). Discrete positions, in which each different probes are located may have any convenient shape, e.g., circular, rectangular, elliptical, wedge-shaped, etc.

35 Attachment of the library sequences to the substrate may be by covalent or non-covalent means. The library sequences may be attached to the substrate via a layer of molecules to which the library sequences bind. For example, the probes may be labelled with biotin and the substrate coated with avidin and/or streptavidin. A convenient feature of using biotinylated probes is that the efficiency of coupling to the solid substrate can be determined easily. Since the polynucleotide probes may bind

only poorly to some solid substrates, it is often necessary to provide a chemical interface between the solid substrate (such as in the case of glass) and the probes. Thus, the surface of the substrate may be prepared by, for example, coating with a chemical that increases or decreases the hydrophobicity or coating with a chemical that
5 allows covalent linkage of the polynucleotide probes. Some chemical coatings may both alter the hydrophobicity and allow covalent linkage. Hydrophobicity on a solid substrate may readily be increased by silane treatment or other treatments known in the art. Examples of suitable chemical coatings include polylysine and poly(ethyleneimine). Further details of methods for the attachment of are provided in
10 US 6,248,521.

Techniques for producing immobilised arrays of nucleic acid molecules have been described in the art. A useful review is provided in Schena *et al.* (1998), which also gives references for the techniques described therein.

Microarray-manufacturing technologies fall into two main categories—synthesis
15 and delivery. In the synthesis approaches, microarrays are prepared in a stepwise fashion by the *in situ* synthesis of nucleic acids from biochemical building blocks. With each round of synthesis, nucleotides are added to growing chains until the desired length is achieved. A number of prior art methods describe how to synthesise single-stranded nucleic acid molecule libraries *in situ*, using for example masking techniques
20 (photolithography) to build up various permutations of sequences at the various discrete positions on the solid substrate. US 5,837,832 describes an improved method for producing DNA arrays immobilised to silicon substrates based on very large scale integration technology. In particular, U.S. Patent No. 5,837,832 describes a strategy called "tiling" to synthesize specific sets of probes at spatially-defined locations on a
25 substrate which may be used to produced the immobilised DNA libraries of the present invention. US 5,837,832 also provides references for earlier techniques that may also be used.

The delivery technologies, by contrast, use the exogenous deposition of prepared biochemical substances for chip fabrication. For example, DNA may also be
30 printed directly onto the substrate using for example robotic devices equipped with either pins (mechanical microspotting) or piezo electric devices (ink jetting). In mechanical microspotting, a biochemical sample is loaded into a spotting pin by capillary action, and a small volume is transferred to a solid surface by physical contact between the pin and the solid substrate. After the first spotting cycle, the pin is washed
35 and a second sample is loaded and deposited to an adjacent address. Robotic control systems and multiplexed printheads allow automated microarray fabrication. Ink jetting

involves loading a biochemical sample, such as a polynucleotide into a miniature nozzle equipped with a piezoelectric fitting and an electrical current is used to expel a precise amount of liquid from the jet onto the substrate. After the first jetting step, the jet is washed and a second sample is loaded and deposited to an adjacent address. A
5 repeated series of cycles with multiple jets enables rapid microarray production.

In one embodiment, the microarray is a high density array, comprising greater than about 50, preferably greater than about 100 or 200 different nucleic acid probes. Such high density probes comprise a probe density of greater than about 50, preferably greater than about 500, more preferably greater than about 1,000, most preferably
10 greater than about 2,000 different nucleic acid probes per cm². The array may further comprise mismatch control probes and/or reference probes (such as positive controls).

Microarrays of the invention will typically comprise a plurality of primers/probes as described above. The primers/probes may be grouped on the array in any order.

15 Elements in an array may contain only one type of probe/primer or a number of different probes/primers.

Detection of binding of *S. pneumoniae* DNA to immobilised probes/primers may be performed using a number of techniques. For example, the immobilised probes which are specific for one or a number of serotypes, may function as capture probes.
20 Following binding of the genomic DNA to the array, the array is washed and incubated with one or more labelled detection probes which hybridise specifically to regions of the *S. pneumoniae* genome which are conserved (for example the *S. pneumoniae* *psaA* or pneumolysin probes/primers described herein could be utilized for this purpose). The binding of these detection probes may then be determined by detecting the
25 presence of the label. For example, the label may be a fluorescent label and the array may be placed in an X-Y reader under a charge-coupled device (CCD) camera.

Other techniques include labelling the genomic DNA prior to contact with the array (using nick-translation and labelled dNTPs for example). Binding of the genomic DNA can then be detected directly.

30 It is also possible to employ a single PCR amplification step using labelled dNTPs. In this embodiment, the genomic DNA fragment binds to a first primer present in the array. The addition of polymerase, dNTPs, including some labelled dNTPs and a second primer results in synthesis of a PCR product incorporating labelled nucleotides. The labelled PCR fragment captured on the plate may then be detected.

35 A number of available detection techniques do not require labels but instead rely on changes in mass upon ligand binding (e.g. surface plasmon resonance- SPR). The

principles of SPR and the types of solid substrates required for use in SPR (e.g. BIACore chips) are described in Ausubel *et al.*, Short Protocols in Molecular Biology (1999) 4th Ed, John Wiley & Sons, Inc.

Examples of the utilization of microarrays in genotyping include the use of
5 microarrays to differentiate between closely related *Cryptosporidium parvum* isolates and *Cryptosporidium* species (Straub *et al.*, 2002), the use of microarrays to differentiate between species of *Listeria* (Volokhov *et al.*, 2002), and the use of microarrays to differentiate within species of *Staphylococcus aureus* (van Leeuwen *et al.*, 2003). The detection principles applied in these studies can be used with the
10 polymorphisms/primers/probes identified by the present inventors to identify different serotypes of *S. pneumoniae* in a sample.

In the present instance, according to 800bp *cpsA-cpsB* alignment results (Figure 2) regions, such as the first 20 nucleotides provided in Figure 2, are scanned to see whether they contains polymorphisms. Where polymorphisms occur, probes can be
15 designed for each "type" (allele)-specific probes (and name them as 1-1, 1-2 , etc.), which will cover all the *cpsA-cpsB* regions for all the known sequence types. The combination of all the above allele-specific probes (about or less than 20 allele x 40~50 =800~1000 probes all together) hybridisation results will define the microarray hybridisation types like MLST (1-0-10-----etc), which would be nearly equal to the
20 sequencing results. Bioinformatics software will tell which sequence type the "specimen/strain" is.

Kits

In one embodiment, kits of the present invention include, in an amount
25 sufficient for at least one assay, a polynucleotide probe of the invention which preferentially hybridizes to a target nucleic acid sequence in a test sample under hybridization assay conditions. Kits containing multiple probes are also contemplated by the present invention where the multiple probes are designed to target different nucleic acid sequences from different *S. pneumoniae* serotypes and may include
30 distinct labels which permit the probes to be differentially detected in a test sample. Kits according to the present invention may further comprise at least one of the following: (i) one or more amplification primers for amplifying a target sequence contained in or derived from the target nucleic acid; (ii) a capture probe for isolating and purifying target nucleic acid present in a test sample; and (iii) if a capture probe is
35 included, a solid support material (e.g., magnetically responsive particles) for

immobilizing the capture probe, either directly or indirectly, in a test sample. Kits of the present invention may further include one or more helper probes.

Typically, the kits will also include instructions recorded in a tangible form (e.g., contained on paper or an electronic medium) for using the packaged polynucleotide in a detection assay for determining the presence or amount of a target nucleic acid sequence in a test sample. The assay described in the written instructions may include steps for isolating and purifying the target nucleic acid prior to detection with the polynucleotide probe, and/or amplifying a target sequence contained in the target nucleic acid. The instructions will typically indicate the reagents and/or concentrations of reagents and at least one assay method parameter which might be, for example, the relative amounts of reagents to use per amount of sample. In addition, such specifics as maintenance, time periods, temperature and buffer conditions may also be included.

15 Uses

As discussed above, *S. pneumoniae* is a leading cause of morbidity and mortality causing invasive disease such as meningitis and pneumonia as well as more localised disease such as acute otitis media and sinusitis. Continued surveillance is critical to monitor vaccine efficacy and changes in incidence and distribution of colonising and invasive serotypes. Any increase in disease caused by previously uncommon nonvaccine serotypes could necessitate a change in vaccine composition. Thus, the detection methods, probes/primer and microarrays of the invention may be used to monitor the epidemiology of invasive *S. pneumoniae* infections to assist in disease control and to inform vaccine policy.

25 The molecular typing methods of the invention may also assist in comprehensive serotype identification that will be useful for epidemiological and other related studies that will be needed to monitor *S. pneumoniae* before and after introduction of *S. pneumoniae* vaccines.

30

35

EXAMPLES

EXAMPLE 1 - Serotyping based on the polymorphisms of the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, combined in some instances with the analysis of the *wzx* and/or *wzy* genes

5 MATERIALS AND METHODS

Pneumococcal reference panels (Table 1)

Reference panels 1-4, which consisted of 118 isolates, were kindly provided and serotyped by colleagues in Australia and Canada. All had been serotyped using the standard Quellung method and included all 23 serotypes represented in the polysaccharide vaccine, and 28 additional serotypes; there were multiple isolates of 40 serotypes and five isolates that could not be serotyped with available antisera. Reference panel 5 consisted of 21 invasive isolates from our diagnostic laboratory at the Centre for Infectious Diseases and Microbiology (CIDM), Sydney, for which serotypes were known at the beginning of the study. These five reference panels were used for the development and preliminary evaluation of molecular capsular sequence methods. Panels 2 and 4 were tested by molecular capsular sequence, initially, without knowledge of the conventional serotyping (CS) results.

Clinical isolates

20 179 consecutive *S. pneumoniae* clinical isolates from normally sterile sites, collected during the period January 1999 to June 2001, by the CIDM diagnostic laboratory, were studied; 21 were randomly selected to make up reference panel 5 (see above). Dr Diana Martin, Institute of Environmental Science and Research (ESR), Wellington, New Zealand provided 103 clinical isolates from diagnostic laboratories throughout New Zealand. Clinical isolates were initially tested using the MCT method, without knowledge of their CS results (single-blind study). Isolates were retrieved from storage by subculture on blood agar plates (Columbia II agar base supplemented with 5% horse blood) and incubated overnight at 37°C CO₂ incubator.

Notes.

1. CS of selected *S. pneumoniae* isolates from reference panels 1 and 3 was repeated by Gail Stewart and Robert Gange at Department of Microbiology, Children's Hospital at Westmead, New South Wales, Australia.
2. MCT was performed and GenBank accession numbers generated by Fanrong Kong at Centre for Infectious Diseases and Microbiology (CIDM), Institute of Clinical Pathology and Medical Research (ICPMR), Westmead Hospital, Westmead, New South Wales, Australia. See text for molecular capsular subtype (mctsp) nomenclature.
3. Provided by Denise Murphy, Pneumococcal Reference Laboratory, Public Health Microbiology, Queensland Health Scientific Services, Queensland, Australia.
4. Provided by Associate Professor Geoff Hogg and Jenny Davis, Microbiological Diagnostic Unit (MDU), Public Health Laboratory, Department of Microbiology and Immunology, University of Melbourne, Victoria, Australia.
5. Provided by Dr. Louise P. Jette, Institut National de Sante Publique du Quebec-Laboratoire de Sante Publique du Quebec, Sainte-Anne-de-Bellevue, Quebec H9X 3R5, Canada.
6. Provided by Dr. Michael Watson, Department of Microbiology, Children's Hospital at Westmead, New South Wales, Australia.
7. Selected 21 *S. pneumoniae* clinical isolates, of which CS results were known, from the CIDM diagnostic laboratory.

8. 152 Australian *S. pneumoniae* clinical isolates, of which CS results were known, from the CIDM diagnostic laboratory.
9. 103 New Zealand *S. pneumoniae* clinical isolates Provided by Dr. Diana Martin, from Streptococcus Reference Laboratory, at Institute of Environmental Science and
- 5 Research (ESR), Wellington, New Zealand.

Conventional serotyping (CS)

- CS was performed by the Quellung reaction using rabbit polyclonal antisera
- 10 from the Statens Serum Institute, Copenhagen, Denmark (Sorensen, 1993). Briefly, 2 μ L of a suspension of isolate, in 10% formalin saline, and 1 μ L of antisera, under a glass coverslip were examined for capsular swelling using a light microscope at 400x magnification. Clinical isolates from CIDM were serotyped at Department of Microbiology, Children's Hospital at Westmead, Sydney, Australia and those from
 - 15 New Zealand by the Streptococcus Reference Laboratory, at ESR, Wellington, New Zealand. Selected New Zealand clinical isolates for which only serogroup results were available and selected isolates from reference panels 1 and 3 were re-tested at Children's Hospital at Westmead.

20 Molecular capsular sequence typing - development of method

Oligonucleotide primers

- The oligonucleotide primers used in this study, their target sites and melting temperatures are shown in Table 2 and the primer pair specificities and expected amplicon lengths in Table 3. Primers were designed with high melting temperatures to
- 25 be used in rapid cycle PCR (Kong et al., 2000).

- Four previously published *S. pneumoniae*-specific primers, targeting *psaA* (P1, P2) (Morrison et al., 2000) and pneumolysin (IIa, IIb) (Salo et al., 1995) were modified to give high melting temperatures and used to confirm that isolates were *S. pneumoniae*. Primers were designed to amplify and sequence portion of the *cpsA-cpsB*
- 30 gene region and to amplify serotype/serogroup-specific sequences in the *wzy* and *wzx* genes of 16 *S. pneumoniae* serotypes for which *cps* gene cluster sequences were available. In order to further explore the sequence heterogeneity, part of the *wzx* and *wzy* genes of isolates belonging to serogroups 6, 18, 23 and 33/37 were also sequenced. For serotype 3, which does not contain *wzy* and *wzx* genes, serotype-specific PCR
 - 35 targeted the *orf2 (wze)-cap3A-cap3B* region (Arrecubieta et al., 1996).

Notes.

1. Primer 7m values provided by the primer synthesiser (Sigma-Aldrich).

2. Numbers represent the numbered base positions at which primer sequences start and finish (starting at point "1" of the corresponding gene GenBank sequence).
3. Underlined sequences show bases added to modify previously published primers.
4. Letters in parentheses indicate alternative nucleotides in different serotypes.
- 5 5. Morrison, et al. 2000.
6. Salo, et al. 1995.
7. For sequencing use only.
- * Primers have been previously published. All others primers designed specifically for this study.

Notes.

1. See Table 2 for primer sequences.
2. For sequencing use only.

5

DNA preparation, PCR and sequencing

DNA extraction, PCR and sequencing were performed as previously described (Kong et al., 2002).

10

Sequence comparison, multiple sequence alignments, and phylogenetic analysis

Sequences were compared using Bestfit in Comparison program group. Multiple sequence alignments were performed with Pileup and Pretty in Multiple Sequence Analysis program group. Phylogenetic relationships were studied using Ednadist and Ekitsch in Evolutionary Analysis program group. All programs are provided in WebANGIS, ANGIS (Australian National Genomic Information Service), 3rd version.

15

Nucleotide sequence accession numbers

The new partial sequence data for *cpsA-cpsB*, *wzy* (polymerase) and *wzx* (flippase) genes for selected reference and clinical isolates reported in this paper have appeared in the GenBank Nucleotide Sequence Databases, with accession numbers AF532632-AF532715, and AF163171-AF163232, respectively (Table 1).

20

Previously reported sequence data used in this paper, in addition to those listed in Table 2, have appeared in GenBank Nucleotide Sequence Databases with the following accession numbers: U15171, U66846 and U66845 (*cps* gene cluster for serotype 3); NC_003028 (serotype 4 genome); AJ239004 (*cps* gene cluster for serotype 8); AF030367-AF030372 (*cps* gene cluster for serotype 19F); AF105113 (partial *cps* gene cluster for serotype 19A); AF105114 and AF106137 (partial *cps* gene

25

clusters for serotype 19B); AF105115 (partial *cps* gene clusters for serotype 19C); AF030373 and AF030374 (*cps* gene clusters for serotype 23F).

RESULTS

5 Both pairs of *S. pneumoniae* species-specific primers (targeting *psaA* and pneumolysin genes) produced amplicons of the expected size from all reference and clinical isolates except six of 179 CIDM isolates, which, on retesting, were optochin resistant and therefore excluded from further study as they were not *S. pneumoniae*.

10 The sequencing primers, *cpsS1/cpsA3*, formed amplicons from all but 13 reference and clinical isolates. Of these 13 isolates, 10 (eight belonging to serotypes 38/25F and two that were nonserotypable) formed amplicons with primer pairs *cpsS1/cpsA1* and *cpsS3/cpsA2*. Three nonserotypable isolates did not form amplicons using any of the primer pairs targeting the *cpsA-cpsB* region, although they had been confirmed to be *S. pneumoniae* using both species-specific PCR.

15

Sequence heterogeneity in the region between the 3'-end of *cpsA* and the 5'-end of *cpsB*

The present inventors sequenced and analyzed 800 bp fragments of the region between the 3'-end of *cpsA* (starting at base pair 951) and the 5'-end of *cpsB* (see 20 Figure 2). Representative sequences were deposited into GenBank (see Table 1 for accession numbers). There were 424 sites that were identical for all 51 serotypes represented among the isolates examined, leaving 376 (47%) heterogeneity sites.

Intra- and inter-serotype/subtype heterogeneity

25 Only single isolates were available for 11 serotypes and the mixed serotype 9V/14 (see below). Among 40 serotypes, for which multiple isolates were available, 14 were divided into molecular capsular sequence types, on the basis of major and/or stable intra-serotype heterogeneity. Molecular capsular sequence types were named according to their conventional serotype (cs) and, generally, the source of the isolate in 30 which the sequence difference was first identified [-g = Genbank sequence; -c (CIDM); -q (Queensland); -ca (Canada); -nz (New Zealand)]. When sequences characteristic of two serotypes were present in the *cpsA-cpsB* region subtype names included both, with the CS first (e.g 23F-23A when CS was 23F; 23A-23F when CS was 23A). Seventeen serotypes had no intra-serotype heterogeneity and in nine there were minor and/or less 35 stable variations between isolates and/or between sequences disclosed herein with corresponding sequences in GenBank (Table 4, Figure 2).

Table 4. Molecular capsular type (MCT) heterogeneity sites in the region between the 3'-end of *cpsA* and the 5'-end of *cpsB* of 51 *S. pneumoniae* serotypes.

Notes.

- a. Key to mcst: -g = Genbank sequence; -c (CIDM); -q (Queensland); -ca (Canada); -nz (New Zealand)
- b. The superscript numbers = number of isolates studied; superscript g = base present in corresponding GenBank sequence

There were 368 heterogeneity sites that allowed differentiation between molecular capsular sequence types, including both specific and shared sites (Table 4, Figure 2).

5 Phylogenetic tree based on region of the 3'-end of *cpsA*-the 5'-end of *cpsB* genes

Using these 800bp sequences, a phylogenetic tree was inferred for the 132 (included the new sequences from Example 2) *S. pneumoniae* molecular capsular sequence type analysis of the *cpsA-cpsB* region (Figure 3 - it should be noted that in Figure 3 the sequence types were renamed based on serotype and their GenBank
10 accession numbers). Typical class I serotypes (e.g. 1, 18C, 19F), a typical class II serotype (e.g 33F, represented by 33F-g) and a nontypical class II serotype (19A) were each in different clusters of the tree (Jiang et al., 2001).

The phylogenetic tree provides evidence for, and suggests possible sources of, recombination between *cpsA-cpsB* genes of classes I and II. For example, subtype 23F-
15 c (or 23F-AF532678) clustered with 15A-c2 (or 15A-AF532647), but in a separate cluster from other 23F and 15A subtypes, suggesting that they may have arisen by recombination between 23F and 15A, respectively, and other serotypes.

Molecular capsular sequence typing based on *cpsA-cpsB* region sequences

20 The molecular capsular sequence type, assigned on the basis of *cpsA-cpsB* sequence, was the same as the CS for all isolates belonging to 36 of 51 serotypes (or 304 of 394 [77%] isolates), and for the majority of isolates (25 of 39) belonging to another five serotypes (Table 5). The remaining isolates in these serotypes shared sequences with other serotypes, namely 6A with 6B, 10A and 23A with 23F, 15B with
25 22F and 17F with 35B, presumably as a result of recombination. There were five serotype pairs, represented by 46 isolates, whose members had identical sequences: namely 20/13, 18C/18B, 38/25F, 31/42 and 33F-g/33A.

Table 5. Comparison of molecular capsular typing (MCT) and conventional serotyping (CS) results of 394 *S.pneumoniae* isolates.

Notes.

1. For nomenclature, see Table 4 and text.
2. *cpsA-cpsB* sequence 3 discrepancies; 2 resolved by *wzx*, *wzy* gene sequences.
3. Six serotype 10A isolates shared *cpsA-cpsB* sequence with 23F-g, but 23F specific PCR (targeting both *wzy* and *wzx*) was negative; 10A-23F was identified by exclusion of 23F in our existing database. However, this relationship needs to be confirmed by examination of a larger collection isolates.
4. *cpsA-cpsB* sequence 1 discrepancy; resolved by *wzx* gene sequence; 23F *wzx* PCR positive/23F negative *wzy* PCR negative also support its identification by exclusion.
5. For one serotype 33A isolate, *cpsA-cpsB* and *wzx* and *wzy* sequences were identical with 33F-g but different from 33F-q; 33F/37 *wzx* and *wzy* PCR were both positive.
6. One serotype 33B strain identified by exclusion: 33F/37 *wzx* PCR positive/33/37 *wzy* PCR negative.
7. All isolates confirmed to be *S. pneumoniae*. These isolates may belong to rare serotypes not represented among our reference isolates.

Molecular capsular sequence typing based on PCR targeting *wzy* and *wzx* (*orf2* [*wze*]-*cap3A-cap3B* for serotype 3)

There is significant sequence heterogeneity in *wzy* and *wzx* (data not shown), which made them suitable PCR targets for serogroup or serotype identification (Tables 2 and 3). With few exceptions, primer pairs targeting these genes formed amplicons only from the corresponding serotypes represented in the five reference panels. Exceptions were: PCR targeting serotype 6B also amplified 6A; PCR targeting 18C amplified all serotypes in serogroup 18; PCR targeting *wzx* (but not *wzy*) of serotype 23F, amplified three serotype 23A strains; PCR targeting *wzx* and *wzy* of serotypes 33/37 amplified a 33A isolate and that targeting *wzx* amplified a serotype 33B isolate.

The specificity of serotype 3-specific primers targeting the *orf2* (*wze*)-*cap3A-cap3B* genes (Arrecubieta et al., 1996) was confirmed by production of an amplicon of the expected size from all 17 serotype 3 isolates. Thus, a serotype or serogroup was assigned by PCR to all 239 isolates belonging to serotypes/serogroups for which specific PCR was developed (Table 5).

Comparison of molecular capsular sequence typing based on *cpsA-cpsB* sequencing and PCR/sequencing targeting *wzx* and *wzy*

The results of PCR and *cpsA-cpsB* sequencing were consistent except that PCR could not distinguish between some members of serogroups 6, 18, 23 and 33/37 and further sequencing (of *wzx*, *wzy*) was required to identify individual molecular capsular sequence types (see below). The *cpsA-cpsB* sequences of six 10A isolates were identical to those of 23F, but the isolates were negative in the 23F-specific PCR targeting *wzx* and *wzy* (10A-23F).

Relationships within serogroups

Sequence analysis of the *cpsA-cpsB* region and *wzy* and *wzx* genes (data not shown) showed variable phylogenetic relationships between members of different serogroups.

Serogroup 6

Serotypes 6A and 6B were divided into five and three subtypes, respectively, based on different sequence patterns in the *cpsA-cpsB* region. Three 6A isolates had sequences in this region characteristic of serotype 6B (Table 4). Serotypes 6A and 6B could not be distinguished by PCR targeting *wzx* and *wzy*. Sequencing of these genes correctly identified all except one 6A isolates, but some 6A and 6B subtypes share

identical or very similar sequences. The serotype of the discrepant isolate (serotype 6A, 6B-q) was checked independently by two laboratories (Vakevainen et al., 2001).

Serogroup 18

5 Serotypes 18C and 18B had identical *cspA-cpsB* region sequences and were close to 18A and 18F in the class I cluster (Figure 3). PCR targeting both *wzx* and *wzy* genes amplified all four serotypes. Sequences of 18C and 18B were identical to each other, but different from those of serotypes 18A and 18F, which were also distinguishable from each other.

10

Serogroup 23

Serotypes 23F, 23A (except 23F-23A and 23A-23F) and 23B were separated into different clusters based on *cpsA-cpsB* sequence differences. Serotype 23A (including 23A-23F) was identified on the basis of a positive result with 23F-specific
15 primers targeting *wzx* and a negative result with the corresponding *wzy* PCR. Sequencing could differentiate individual serotypes (23A, 23F and 23B) except 23F-23A and 23A-23F. Most 23F-c, 23A-23F and 23F-23A have apparently arisen by recombination between 23F, 23A and/or others, producing sequences in the *cpsA-cpsB* regions that are quite different from their parental types.

20

Serogroups 33 and 37

Serotypes 33A and 33F-g share identical *cpsA-cpsB* sequences and that of 33B is similar; 37 and 33F-g cluster together, as do 33B and 33F-q (Figure 3). The 33F/37-specific *wzx* PCR amplified 37, 33F, 33A and 33B, indicating similarities at that site,
25 although sequencing showed clear differences between 33B and the others. The 33F/37-specific *wzy* PCR amplified 37, 33F and 33A but not 33B. Thus, mct 33B was identified on the basis of a positive result with 33F/37-specific primers targeting *wzx* and a negative result with the corresponding *wzy* PCR.

30 *Other serogroups*

Despite antigenic similarities that determine their membership of the same serogroup, serotypes 9N and 9V appear to be genetically distant, on the basis of significant differences between their *cpsA-cpsB* sequences and the fact that 9V-specific PCR did not amplify 9N.

35 Similarly, mct 19F and 19A had quite different *cpsA-cpsB* region sequences and separated into different clusters. 19F-specific PCR did not amplify 19A and vice versa.

There were differences between mct 19F, 19A, 19B, 19C in *wzx* and *wzy* sequences (except *wzy* sequence of 19C was not available in GenBank), but they formed two groups - 19F, 19A and 19B, 19C.

Serotypes 7F and 7C separated into different clusters based on *cpsA-cpsB* sequences, as did 11A and 11B (Figure 3). Serotypes 15B and 15C had similar *cpsA-cpsB* sequences and clustered together, except for 15B-22F. Serotypes 17F (including 17F-c and 17F-35B) and 17A were clustered together. Serotypes 35F and 35B are closely related based on similar *cpsA-cpsB* sequences.

10 Mixed culture

One clinical isolate identified as serotype 9/14 using antisera was positive in 9V- and 14-specific PCR (targeting both *wzx* and *wzy*), but was identified as mct 9V by sequencing. The isolate was subcultured and 16 individual colonies were rested. All 16 colonies were positive in both mct 9V-specific and negative in both 14-specific PCR assays and were identified as mct 9V by sequencing. The serotype of the original isolate was rechecked and the results (mixed serotype 9/14) were as before. It was therefore assumed that the original isolate was a mixture, predominantly of serotype 9V with a minor component of serotype 14.

20 Comparison of serotype identification results between molecular capsular sequence typing and CS

After CS and molecular capsular sequence typing had been completed, the results were compared. Initial results were discrepant for 29 isolates; repeat serotyping and/or correction of clerical errors resolved all but five discrepancies. Final results correlated between CS and molecular capsular sequence typing methods for all isolates of 38 serotypes (318 isolates), 20 of 25 of another three serotypes and all five nonserotypable isolates (total 343 isolates). In addition, there were 46 isolates belonging to pairs of serotypes whose members could not be distinguished from each other by molecular capsular sequence typing but all were assigned to the pair that included the serotype to which they had been assigned by CS. These results were classified as consistent.

The five discrepant results were: one isolate of serotype 6A was identified as 6B-q, two isolates of serotype 15B were identified as 22F and two isolates of serotype 17F as 35B.

Algorithm for serotype assignment of *S. pneumoniae* by molecular capsular sequence typing

An algorithm for practical use of the molecular capsular sequence typing method for the identification of *S. pneumoniae* serotypes is shown in Table 6.

5

DISCUSSION

Sequences of 16 *cps* gene clusters showed that all have the same four genes at their 5' ends - *cpsA* (*wzg*)-*cpsB* (*wzh*)-*cpsC* (*wzd*)-*cpsD* (*wze*) - which are the sites for recombination events that generate new forms of capsular polysaccharide. The
10 sequences for different serotypes can be divided into two classes and show evidence of interesting recombination patterns.

The study of 51 serotypes, of which 40 were represented by more than one isolate, showed that the *cpsA-cpsB* sequences for the same serotypes were generally stable or could be consistently divided into a small number of subtypes. This shows that
15 sequence patterns in this region can be used to identify different serotypes/serosubtypes.

It has been shown previously that PCR-RFLP based on the *cpsA-cpsB* region can predict *S. pneumoniae* serotypes (Lawrence et al., 2000). However, the method generates a long amplicon (1.8kbp), requires the use of three restriction enzymes and
20 special equipment and has limited discriminatory ability.

The present inventors identified 376 sequence heterogeneity sites, in the *cpsA-cpsB* region, among the 51 serotypes studied (Table 4, Figure 2), which allowed a practical MCT assay based on sequencing to be developed. Several pairs of primers were designed to amplify a 1001 bp segment within the *cpsA-cpsB* region, based on the
25 following considerations. The primers formed amplicons from virtually all, *S. pneumoniae* isolates (>99% of those examined); the amplicon is small enough to be amplified using normal PCR protocols; the region of interest (800bp) can be sequenced using a single reaction and the method is objective. The target included most of the variable sites (bp 951 to 1747), providing maximum discrimination between closely
30 related serotypes (e.g. members of serogroups 33 and 37 that could not be distinguished by serotype/group-specific PCR).

Table 6. Algorithm for *S. pneumoniae* molecular capsular sequence type identification by sequencing and serotype/group-specific

PCR.

Amplification primer pairs*	PCR product size (base pairs)	Interpretation
<i>S. pneumoniae</i> identification primer pairs		
P1/P2	864	<i>S. pneumoniae</i>
<i>S. pneumoniae</i> mct identification by sequencing		
cpsS1/cpsA3 (for most MCT)	1001	1. Purification PCR amplicons
or	or	2. Sequencing PCR amplicons
cpsS1/cpsA1+ cpsS3/cpsA2 (for MCT 38/25F and some nontypable isolates)	520+503	3. Using programmes (Pileup & Pretty or Ednadist & Ekitsch etc.) in ANGIS to analyse sequences to identify mct/mcst
		4. Refer to Figure 1/Table 4 to identify/confirm mct/mcst.
<i>S. pneumoniae</i> mct identification by serotype/group-specific PCR		

See Table 2 for primer sequences* and Table 3 for specificity and amplicon lengths of primer pairs. Only selected molecular capsular sequence types and isolates need to be identified using the full testing algorithm.

Some of the 376 heterogeneity sites in the *cpsA-cpsB* region were specific for individual molecular capsular sequence type (Table 4, Figure 2), while others were shared between several. Based on these patterns, plus PCR and selective sequencing of type-specific regions of *wzx* and *wzy*, most of the 51 serotypes represented among our 394 isolates could be distinguished and further divide them into a total of 71 molecular capsular sequence types, with the aid of sequence analysis software. The final CS and molecular capsular sequence typing results correlated for 343 isolates of 389 (88%) for which results for both methods were available, including five that were nontypable by either method. For 46 isolates belonging to five serotype pairs, members of which could not be distinguished by sequencing, results were classified as consistent leaving unresolved discrepancies between methods for only five (1.2%) isolates.

Sequence analysis of the *cps* gene clusters of 16 serotypes showed that *wzy* (capsular polysaccharide polymerase gene) and *wzx* (capsular polysaccharide flippase gene) are highly variable, making them suitable targets for direct serotype identification by PCR. The present inventors designed serotype-specific PCR primers for these serotypes, targeting *wzx* and *wzy* and, for serotype 3, which has no *wzy* and *wzx* genes, targeting *orf2 (wze)-cap3A-cap3B* (Arrecubieta et al., 1996). It was found that presumed serotype-specific primers for 6A, 18C, 23F and 33F/37 were not serotype-specific, but amplified other related serotypes. To improve the molecular capsular sequence typing methods, portions of the *wzy* and *wzx* genes of serotypes within these groups were sequenced, which allowed molecular capsular sequence types to be distinguished within these serotypes/groups and demonstrate relationships between them.

The present inventors have recognized that the large number of pneumococcal serotypes would make it impractical to use serotype-specific PCR for all of them. Nevertheless, *wzy* and *wzx* PCR can be used to resolve discrepancies between CS and *cpsA-cpsB* region sequencing assays e.g. for molecular capsular sequence types 10A-23F and 23A-23F. Moreover, the use of two target regions in the *cps* gene cluster helps to clarify the relationships between most that have apparently arisen by recombination. Serotype/group-specific primers were evaluated using three reference panels, which had been characterised by CS and used to identify clinical isolates of unknown cs. By PCR alone, 239 (61%) of our 394 clinical isolates were assigned to a serotype or serogroup (Table 5). This method can be extended to other mct, when additional *wzx* and *wzy* sequences are available.

In some circumstances, sequencing of the *cpsA-cpsB* region may be more practical than type-specific PCR. For most serotypes only a single method and fewer primers (*cpsS1/cpsA3*-for most serotypes/isolates) are needed.

Previous studies have shown that serotypes included in 23-valent polysaccharide and 11-, 9-, 7-valent protein conjugate vaccines are those most frequently isolated from normally sterile sites (CSF, blood) (Colman et al., 1998; Huebner et al., 2000). Among 173 consecutive pneumococcal "sterile site" isolates from adults in the CIDM diagnostic laboratory, over a 2.5-year period, correlation between the mct and cs was good (171/173 CIDM isolates were correctly identified). The exceptions were two serotype 15B isolates that were identified as molecular capsular sequence type 22F. Five serotypes (4, 14, 19F, 23F, 9V –covered by all pneumococcal vaccines) accounted for 57% of isolates.

Five of 394 isolates studied were nontypable by both CS and molecular capsular sequence typing (Barker et al., 1999). Isolates may be nonserotypable because of decreased type-specific-antigen synthesis, nonencapsulated phase variation or insertion or mutation of genes of *cps* gene clusters. Failure to type them by molecular capsular sequence typing reflects the fact that the sequence database is still incomplete (also the reason for the further research in Example 2), although the target regions of two of the five nonserotypable isolates have been sequenced.

In summary, the present inventors have developed a molecular capsular sequence typing system for *S. pneumoniae*, which is reproducible, can be performed by any laboratory with access to PCR/sequencing and does not require large panels of expensive serotype-specific antisera. Work on an international collection of isolates in our reference panels demonstrated a strong correlation between the *cpsA-cpsB* sequence and CS. Heterogeneity in a relatively short sequence (800bp) in this region, supplemented by serotype/group-specific PCR targeting *wzx* and *wzy*, correctly predicted the serotype of most unknown isolates belonging to 51 serotypes. These novel molecular capsular sequence typing methods provide comprehensive strain identification that will be useful for epidemiological studies that will be needed to monitor serotype distribution and detect serotype switching, if any, among *S. pneumoniae* isolates before and following introduction and widespread use of conjugate vaccines.

EXAMPLE 2 - Identification of *S. pneumoniae* serotypes by analysis of the *wzx* and/or *wzy* genes

MATERIALS AND METHODS

Pneumococcal clinical isolates

5 This study was based on 92 well-characterized *S. pneumoniae* isolates, which represented 55 serotypes and including about 31 of 39 serotypes that were not included in Example 1. The sources of these isolates were 72 from China Medical Bacteria Culture Collection Center, Beijing, PR China; 17 from Royal College of Pathologists of Australasia, Quality Assurance Program Pty Limited, New South Wales, Australia; 10 three from Associate Professor Geoff Hogg and Ms Jenny Davis, Microbiological Diagnostic Unit (MDU), Public Health Laboratory, Department of Microbiology and Immunology, University of Melbourne, Victoria. Conventional serotyping (CS) had been performed by donor laboratory and serotypes of the 75 strains were known at time of receipt and 23 selected isolates (including all of serotypes 27, 28F and 16A isolates 15 and two from Example 1 – which had been identified as one each of serotype 42 and 41F strains each) were re-tested by the Quellung reaction – as described above – at Department of Microbiology, Children's Hospital at Westmead (Henrichsen, 1999).

Isolates were retrieved from storage by subculture on blood agar plates (Columbia II agar base supplemented with 5% horse blood) and incubated overnight at 20 37°C in 5% CO₂.

Annotation and analysis of *wzx* and *wzy*

Analysis of homology and protein hydrophobicity was performed to annotate the *wzx* and *wzy* genes in *S. pneumoniae* *cps* gene cluster. Blast and PSI-blast (Altschul 25 et al., 1997) were used for searching databases including GenBank and Pfam protein motif database (Bateman et al., 2002) for possible gene functions. The TMHMM v2.0 analysis program (Chen et al., 2003) was used to identify potential transmembrane segments from the amino acid sequence. Sequence alignment and comparison were done using the program ClustalW (Thompson et al., 1994). The phylogenetic trees were 30 generated by neighbour-joining method using programme MEGA (Kumar et al. 1994) (Figures 4 and 5).

Oligonucleotide primers

In addition to our previous MCT primers (Example 1) numerous serotype(s)- 35 specific oligonucleotide primers, targeting *wzy* and *wzx* (one pair), were designed for this study. The specificity, sequences, numbered base positions and melting

temperatures (T_m) are shown in Table 7. Expected amplicon lengths of different primer pairs can be calculated from the 5'-end positions of the corresponding primers.

DNA preparation, PCR, sequencing and sequence analysis

- 5 DNA extraction, PCR, sequencing and sequence analysis were performed as described Example 1. The only exception was that, for the new PCRs, 55-60°C was used as annealing temperature because of the low T_m values of the new primers.

Nucleotide sequence accession numbers

- 10 56 new sequences generated in this study, for partial *cpsA* (*wzg*)-*cpsB* (*wzh*) genes were deposited in GenBank with accession numbers: AY508586-AY508641. These sequences form part of the present invention.

RESULTS AND DISCUSSION

15 Conventional serotyping (CS) results

- Conventional serotyping, of 23 strains, was repeated because of apparent sharing of sequence types between two or more serotypes. After careful repetitions by two different persons, a previous serotype 42 isolate was confirmed to be serotype 31 and a previous serotype 41F isolate to be serotype 41A (Example 1); serotypes of three
20 additional isolates were also corrected. The serotypes of the other 15 isolates were confirmed to be as previously defined (including all the serotypes 27, 28F and 16A isolates, one each of serotypes 6A, 38 and 25F isolate). The final results are shown in Table 8.

25 Partial *cpsA*-*cpsB* sequencing primers

- The sequencing primers *cpsS1*-*cpsA3* produced amplicons from all strains studied in this and our previous study, except for two belonging to rare serotypes, 25F and 38, and five that were non-serotypeable (Example 1). Two additional primer pairs, *cpsS1*-*cpsA1* and *cpsS3*-*cpsA2*, formed amplicons from strains belonging to serotypes
30 25F and 38 and two non-serotypeable isolates.

Updated sequence type nomenclature (compared with Example 1)

- Sequence types were generally named according to the corresponding serotype, with a suffix representing the source of the isolate for which the sequence type was first identified. When sequences characteristic of two to five serotypes were identified, the sequence type name included all, with the lower number serotype first (e.g 15B-15C-22F-22A etc.) (Henrichsen, 1995). Representative sequences of all sequence types were deposited into GenBank (see Table 8 for sequence type nomenclature and corresponding GenBank accession numbers).

Table 8. *S. pneumoniae* partial *cpsA-cpsB* sequence (~800 bp) database and comparison of molecular capsular typing (MCT) and conventional serotyping (CS) results of 519 *S. pneumoniae* isolates (and also including 24 GenBank sequences and 92 Sanger Institute sequences).

CS ^a	Sequence types (n=) ^{ab}	GenBank (positions) ^c	No. (n=) ^a	Serotype/group-specific (n=) ^a	PCR	Final MCT (n=) ^{ab}	Comments ^{ad}

Notes.

a. Bold letter/numbers indicate results "consistent" (see below for their definition) between MCT and CS; limited CS is needed to distinguish 2-5 serotypes within sequence types, also see text for further explanations. NT=nonserotypeable or nontypeable. Figures in parentheses indicate number of isolate and strain source for the 87 strains used in the study, the GenBank and Sanger Institute strains were also calculated into the total numbers.

b. For explanation of sequence type nomenclature, see text. Key: -g (GenBank sequence); -c (CIDM); -n (New South Wales); -q (Queensland); -w (Western Australia); -v (Victoria); -ca (Canada); -nz (New Zealand); -cn (China); -qap (QAP programme); -s (Sanger). Different serotypes/sequence types that share the same sequences are bolded.

c. GenBank sequence accession numbers for corresponding sequence type: Those before "," are described by the others, one sequence start and stop positions corresponding the ~800 bp regions were given; those behind "," are the sequences we studied; the sequence behind "7" were got from Sanger Institute Streptococcus pneumoniae capsular loci sequence project sequence start and stop positions corresponding the ~800 bp regions are given.

d. "Correlate" means that MCT and CS results were identical; "consistent" means that components of MCT results (sequence type or PCR) correlated with more than one (2-5) CS result.

e. Serogroup 18 PCR positive and 11A-11D specific PCR negative, which can confirm the strains would be 18F.

f. Serotype 17F PCR negative.

g. 7C and 19B-19C PCR negative, 24B could be identified by exclusion.

h. One previous 42 strain (Example 1) was finally proved to be 31 – after twice repeat conventional serotyping and serotype 31-specific PCR positive.

i. One previous 41F strain (Example 1) was finally proved to be 41A – after twice repeat conventional serotyping.

j. Some of these isolates may belong to rare sequence types or even serotypes (other than the known 90 serotypes) not represented among our reference isolates.

Are the shared sequence types plausible?

In order to explain the many shared sequence types, we studied their antigenic formula (Henrichsen, 1995). Among the 31 shared sequence types (Table 9), six were shared between unrelated serotypes (2-41A, 10A-17A, 10A-23F, 13-20, 25A-29, 33D-48), three were shared between two to three related and at least another unrelated serotype (7B-40, 11A-11D-18F, 27-28F-28A, 17F-35B-35C-42) and 20 were shared between antigenically related serotypes. The remaining shared sequence type involved serotypes 16A and 28F; although they are not directly related, 28F is related to serogroup 16 (Table 9) (Henrichsen, 1995). Thus most shared molecular capsular or sequence types (genotypes) involve closely related serotypes (or phenotypes). The 10 shared sequence types that involve unrelated or more distantly related (such as 16A-28F) serotypes probably can be explained by recombination events between serotypes.

Are *wzx* and *wzy* helpful?

In Example 1 it was shown that *wzy* and *wzx* based PCRs increase the accuracy of *cpsA-cpsB* sequence-based serotype prediction. Thus, in order to extend our serotype-prediction strategy to all 90 serotypes, we examined the *wzx* and *wzy* sequences of the 90 serotypes, especially the 31 shared sequence types (Tables 7 and 9). In addition to the sequences we have determined, the unannotated sequences from the *cps* gene clusters of all 90 serotypes as determined by the Sanger Institute was used to determine the 90 *wzx* and *wzy* sequences. The identical of suitable serotype-specific *wzx* and *wzy* based primers was far from straightforward. For most of the 90 serotypes, *wzy* is shorter but more heterogeneous than *wzx* and therefore a more suitable single target for serotype-specific PCR. The *wzy* sequencing results showed that it would be helpful for the discrimination of 7C-40, 10F-10C, 12A/46 (identical)-12F/12B/44 (identical), 35A-35C/42 (identical), 35F-47F serotype(s) pairs.

It is shown that *wzx* genes from 28 different serotypes share high-level homology (72% to 100%). We found three main recombination sites in these 28 *wzx* (base positions 395, 775 and 1150) using the programme PhylPro 1.0 (Weiller 1998), which generated the diagrammatic representation of polymorphic sites and hypothetical recombination events of the *wzx* gene shown in Figure 6.

Table 9. The relationship between shared *S. pneumoniae* partial *cpsA-cpsB* sequence (798-800 bp) type and conventional serotyping (CS) antigenic formulas.

Notes.

- a. Those conventional serotypes (CS) that could share the same sequence types.
- b. Those sequence types that could be shared by different (2-5) conventional serotypes.
- c. Bold parts showed that the factor antiserum are shared by all the shared sequence types related serotypes; underline part showed that the factor antiserum are shared by partial (2-4) shared sequence types related serotypes.
- d. NCR: no cross-reaction of any factor antiserum in the antigenic formulas between serotypes that share sequence types (Henrichsen, 1995).
- e. Sequence identity was calculated by the comparison of wzx and wzy sequences – the others wzx and wzy compared the first CS in the several sharing ST CS. SD: significant length and sequence differences (heterogeneity) between wzx or wzy.
- f. Only selected some PCR to show cases and the “serotype-specific” PCR was only evaluated within the related CS that shared sequence types. IP=impossible (or unlikely) to design real serotype-specific PCR primers to differentiate between the share sequence serotypes because the very high wzx and wzy sequence similarity.
- g. Only those with very high wzx and wzy sequence similarity serotypes cps gene cluster comparison results are shown.

Comprehensive molecular capsular sequence typing results

The final molecular capsular sequence typing results for 519 isolates (427 previously studied and 92 new isolates) are shown in Table 9. Our database now includes 90 *S. pneumoniae* serotypes and 134 sequence types (including two non-serotypeable strains). 83 serotypes are represented by 2 or more strains. 102 sequence types (not including two nonserotypeable strains), including 47 that are represented by two or more isolates, correspond to a single serotype; 23 sequence types are shared by two serotypes, six are shared by three serotypes and two are shared by four serotypes (Table 8).

CLAIMS

1. A method of distinguishing between at least 25 different serotypes of *Streptococcus pneumoniae* in a sample, the method comprising,
 - 5 i) analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, and/or
 - ii) analysing at least a portion of the *wzy* and/or *wzx* gene(s).
2. The method of claim 1 which distinguishes between at least 70 different
10 serotypes of *Streptococcus pneumoniae* in a sample.
3. A method of determining the serotype of *Streptococcus pneumoniae* in a sample, the method comprising,
 - 15 i) analysing at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, and/or
 - ii) analysing at least a portion of the *wzy* and/or *wzx* gene(s),wherein the serotype is selected from the group consisting of: 2, 7A, 7B, 7C, 9A, 9L, 10F, 10A, 10B, 10C, 11F, 11A, 11B, 11C, 11D, 12F, 12A, 12B, 13, 15F, 15A, 15B, 15C, 16A, 17F, 17A, 18F, 18A, 18B, 21, 22F, 22A, 24F, 24A, 24B, 25F, 25A, 27, 28F,
20 28A, 31, 32F, 32A, 33F, 33A, 33B, 33C, 33D, 34, 35A, 35B, 35C, 36, 37, 38, 39, 40, 41F, 41A, 42, 43, 44, 45, 46, 47, 47A and 48.
4. A method of determining the serotype of *Streptococcus pneumoniae* in a sample, the method comprising analysing at least a portion of the nucleotide sequence
25 between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene.
5. The method of claim 4, wherein the portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene which is analysed is any nucleotide which is polymorphic between at least some of the *S. pneumoniae* serotypes
30 referred to in Figure 2.
6. The method of claim 4 or claim 5, wherein the method comprises amplifying at least a portion of the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, and sequencing the amplification product.
35
7. The method of claim 6, wherein the entire approximate 800 bp region as provided in Figure 2 is amplified and sequenced.

8. The method of claim 7, wherein the amplification is performed using primer pairs comprising a sequence selected from the group consisting of:

- 1) GGCATT(/C)TATGGAGTTGATTTCG(/A)TCCATT(/C)CACAC(C/T)TTAG
(SEQ ID NO:68) and
5 GC(/T)TCAATG(/A)TGG(/A)GCAATG(/T)ACTGGA(/C)GTA(/G)ATTCCCA(/G)A
CATC (SEQ ID NO:73),
2) GGCATT(/C)TATGGAGTTGATTTCG(/A)TCCATT(/C)CACACC(/T)
TTAG (SEQ ID NO:68) and
CCATCAC(/T)ATAGAGGTTAC(/A)TG(/A)TCTGGCATT(/C)GC (SEQ ID NO:71),
10 3) GAAAGTGGG(/A/T)GGG(/A/T)A(/G)A(/C)T(/G)TAT(/C)AAAGTA(/G)
AATTCT(/G)CAAGAT(/C)TTA(/G)AAA(/G)G (SEQ ID NO:70) and
T(/G)CATG(/A)CTA(/G)AAC(/T)TCT(/A)ATC(/T)AAG(/A)GCATAACGACTATC(/
T) (SEQ ID NO:72), and
4) primer pairs that amplify the same region, or diagnostic portion thereof, from
15 the genome of a strain of *S. pneumoniae* as the primers provided in 1) to 3).

9. The method of claim 4, wherein the nucleotide sequence analysis step comprises determining whether a polynucleotide obtained from *S. pneumoniae* selectively hybridises to a polynucleotide probe comprising one or more polymorphic regions of
20 the nucleotide sequence between the 3' end of the *cpsA* gene and the 5' end of the *cpsB* gene, wherein such polymorphic regions are shown in Figure 2.

10. The method of claim 9, wherein the nucleotide sequence analysis step comprises a plurality of said polynucleotide probes.

25

11. The method of claim 9 or claim 10, wherein the polynucleotide probe(s) is present as a microarray.

12. A method of determining the serotype of *Streptococcus pneumoniae* in a
30 sample, the method comprising analysing at least a portion of the *wzy* and/or *wzx* gene(s).

13. The method of claim 12 which comprises amplifying at least a portion of the *wzy* and/or *wzx* gene(s), and determining the length of the amplification product.

35

14. The method of claim 13, wherein at least a portion of the *wzy* and/or *wzx* gene(s) is amplified using a primer comprising a sequence selected from any one of SEQ ID

NO's 75 to 139 or 144 to 333, or a primer that can be used to amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as a primers provided as any one of SEQ ID NO's 75 to 139 or 144 to 333.

- 5 15. A method of determining the serotype of *Streptococcus pneumoniae* in a sample, the method comprising performing a method according to any one of claims 4 to 11, and the method according to any one of claims 12 to 14.
16. A method of identifying serotype 3 of *Streptococcus pneumoniae* in a sample,
10 the method comprising a method according to any one of claims 4 to 11, and analysing the *orf2 (wze)-cap3A-cap3B* region.
17. The method of claim 16, wherein the *orf2 (wze)-cap3A-cap3B* region is analysed by amplifying a portion of the *orf2 (wze)-cap3A-cap3B* region using primer
15 pairs selected from the group consisting of:
 - 1) GCACAAAAAAAGTTTGATATTCCCCTTGACAATAG (SEQ ID NO:140) and GCAGGATCTAAGGAGGCTTCAAGATTCAACTC (SEQ ID NO:141),
 - 2) CGAACCTACTATTGAGTGTGATACTTTTATGGGATACAGAG (SEQ
20 ID NO:142) and CTGACAGCATGAAAATATATAACCGCCCAACGAATAAG (SEQ ID NO:143), and
 - 3) primer pairs that amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as the primers provided in 1) or 2)
- 25 18. The method according to any one of claims 1 to 17, the method further comprising detecting any serotype of *Streptococcus pneumoniae* in the sample.
19. The method of claim 18, wherein the *psaA* and/or pneumolysin genes, or a portion thereof, is amplified.
- 30 20. The method of claim 19, wherein a portion of the *psaA* gene is amplified using primers comprising the sequence
TACATTACTCGTTCTCTTTCTTTCTGCAATCATTCTTG (SEQ ID NO:64) and
TAGTAGCTGTCGCCTTCTTTACCTTGTTCTGC (SEQ ID NO:65), or primer pairs
35 that amplify the same region, or diagnostic portion thereof, from the genome of a strain of *S. pneumoniae* as SEQ ID NO:64 and SEQ ID NO:65.

22. An isolated polynucleotide comprising a sequence of nucleotides selected from those provided as SEQ ID NO's 2 to 63, or a fragment thereof which is at least 10 nucleotides in length, with the proviso that the polynucleotide does not comprise the entire *wzy* and/or *wzx* gene(s) of a *S. pneumoniae* serotype selected from the group consisting of: 1, 2, 4, 6A, 6B, 8, 9V, 14, 18C, 19F, 19A, 19B, 23F, 33F and 37, or the entire *wzx* gene of *S. pneumoniae* serotype 19C.

23. An isolated polynucleotide comprising a sequence of nucleotides selected from
15 the group consisting of: 1-AF532632, 10A-AF532633, 10A-AF532634, 10B-

- AY508631, 48-AY508632, 48-AY508633, 5-AF532696, 5-AF532697, 5-AY508634, 6A-AF532698, 6A-AF532699, 6A-AF532700, 6A-AF532701, 6A-AF532702, 6A-AY508641, 6B-AF532703, 6B-AF532704, 6B-AF532705, 7A-AY508635, 7B-AY508636, 7C-AF532706, 7F-AF532707, 8-AF532708, 9A-AY508637, 9L-AY508638, 9N-AF532709, 9V-AF532710 and 9V-AY508639 as provided in Figure 2, or a fragment thereof which is at least 10 nucleotides in length, with the proviso the polynucleotide does not comprise the 3' end of the *cpsA* gene to the 5' end of the *cpsB* gene of a *S. pneumoniae* serotype selected from the group consisting of: 1, 2, 3, 4, 6A, 6B, 8, 9V, 14, 18C, 19F, 19A, 23F, 33F and 37.
- 10 24. An isolated polynucleotide consisting essentially of 10 to 50 contiguous nucleotides corresponding to a portion of the 3' end of the *cpsA* *S. pneumoniae* gene or the 5' end of the *cpsB* *S. pneumoniae* gene.
- 15 25. A polynucleotide consisting essentially of 10 to 50 contiguous nucleotides corresponding to a portion of the *S. pneumoniae* *wzy* and/or *wzx* gene(s).
- 20 26. The polynucleotide of claim 24 or claim 25, wherein said polynucleotide comprises one or more nucleotides which differ between different *S. pneumoniae* serotypes.
27. The polynucleotide of claim 26, wherein the nucleotides which differ between *S. pneumoniae* serotypes correspond to one or more of positions as shown in Figure 2.
- 25 28. A composition comprising a plurality of polynucleotides according to any one of claims 22 to 27 and an acceptable carrier or excipient.
29. A microarray comprising a plurality of polynucleotides according to any one of claims 22 to 27.
- 30 30. The use of a microarray according to claim 29 for serotyping a strain of *S. pneumoniae*.
31. A kit comprising at least one polynucleotide according to any one of claims 22 to 27.
- 35

C (Continuation). DOCUMENTS CONSIDERED TO BE RELEVANT		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	Lawrence et al. "Evaluation of serotype prediction by cpsA-cpsB gene polymorphism in <i>Streptococcus pneumoniae</i> " Journal of Clinical Microbiology (2000) Vol 38(4): pages 1319-1323 (see the whole document)	1-11, 18-22, 25-31
P,X	Kong and Gilbert. "Using cpsA-cpsB sequence polymorphism and serotype-/group-specific PCR to predict 51 <i>Streptococcus pneumoniae</i> capsular serotypes" Journal of Medical Microbiology (2003) Vol 52: pages 1047-1058 (see the whole document)	1-31

INTERNATIONAL SEARCH REPORT

International application No.

PCT/AU2004/000480

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

See Extra Sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/AU2004/000480

Supplemental Box

(To be used when the space in any of Boxes I to VIII is not sufficient)

Continuation of Box No: III

Rule 13.1 of the PCT requires that an International Application should relate to one invention only, or if there is more than one invention, that the inclusion of those inventions in one International Application is only permitted if all inventions are so linked as to form a single general inventive concept. Unity of invention exists only when there is a technical relationship among the claimed inventions involving one or more of the same or corresponding "special technical features". The expression "special technical features" is defined in Rule 13.2 as meaning those technical features that define a contribution that each of the inventions, considered as a whole, makes over the prior art. Accordingly the following three inventions have been found.

Invention 1

Claims 4-11, 16, 17, 23, 24 and 27 completely and claims 1-3, 15, 18-21, 26 and 28-31 in part, recite methods for serotyping *Streptococcus pneumoniae* based on analysis of the nucleotide sequence between the 3' end of the *cps A* gene and the 5' end of the *cpsB* gene, and polynucleotide sequences spanning the region between the 3' end of the *cps A* gene and the 5' end of the *cpsB* gene.

Invention 2

Claims 1-3, 12-15, 18-22, 25, 26, 28-31 in part, relate to methods of serotyping *Streptococcus pneumoniae* based on analysis of the *wzy* gene or portion thereof, and nucleotide sequences comprising at least the *wzy* gene from different *S. pneumoniae* strains.

Invention 3

Claims 1-3, 12-15, 18-22, 25, 26, 28-31 in part, relate to methods of serotyping *Streptococcus pneumoniae* based on analysis of the *wzx* gene or portion thereof, and nucleotide sequences comprising at least the *wzx* gene from different *S. pneumoniae* strains.

Although the claims share the feature that they relate to *S. pneumoniae* capsular (*cps*) genes, these genes and their use in molecular serotyping of *S. pneumoniae* are known. Jiang et al teaches serotype variation in the *wzg*, *wzh*, *wzx* and *wzy* genes. Therefore methods of serotyping *Streptococcus pneumoniae* or *cps* sequences can not be regarded as a unifying technical feature.
